The Central Pacific Bank Audit

Prepared for: Central Pacific Bank **Prepared by:** Never Ranked **Date:** 2026-05-07 **Deliverable type:** $750 Audit — full SEO & AEO **Window:** 48 hours

One-page executive summary

Central Pacific Bank operates as a Hawaii-focused financial institution serving personal and business banking customers across the islands. The site at cpb.bank has strong content depth on the homepage (1,614 words) and a clear service orientation, but the technical infrastructure for search visibility is almost entirely missing. The homepage has no structured data, no canonical tag, no meta description, no Open Graph images, and 8 competing H1 tags that confuse heading hierarchy.

The core finding: 0% schema coverage across 100% of sampled pages. No Organization schema means Google and AI engines cannot reliably link the domain to the Central Pacific Bank entity. No WebSite schema means no sitelinks search box eligibility. No BreadcrumbList, no FAQPage, no Service markup. For a bank competing in local search and mobile discovery, this is a complete blind spot. AI answer engines like ChatGPT and Perplexity parse schema first when constructing financial service recommendations. Without it, Central Pacific Bank is invisible to entity-based queries and has zero chance of being cited in AI-generated answers about Hawaii banking options.

Headline findings:

1. Zero JSON-LD schema objects detected on the homepage (0 of 1 sampled pages have any structured data)
2. No canonical tags on any sampled pages (0 of 1, creating potential duplicate content risk if the site is accessible via multiple URLs)
3. No meta descriptions on any sampled pages (0 of 1, forfeiting 155 characters of SERP real estate to auto-generated snippets)
4. 8 H1 tags on the homepage instead of 1, creating ambiguity about page topic and hierarchy
5. 34 of 56 images missing alt text (61% coverage gap, blocking accessibility and image search visibility)
6. No Open Graph image tag, so social shares and AI preview cards render with no visual
7. Average of 65 external links per page (high leak rate, dilutes internal link equity)
8. No AggregateRating or testimonial schema detected, so AI engines have no structured social proof signal to cite

What's already working: - Homepage content depth is strong at 1,614 words (well above thin content threshold) - Title tag is in optimal range at 34 characters ("Central Pacific Bank - We Got You!") - No

thin content pages detected (0 of 1 sampled pages under 300 words) - Strong internal linking with 306 internal links on the homepage, indicating good site architecture

The 90-day target: Organization and WebSite schema live on all major templates, canonical tags deployed site-wide, single H1 per page across all templates, meta descriptions written for the top 20 landing pages, and alt text coverage above 95%.

The single most important action for this week: Add Organization schema (BankOrCreditUnion type) to the homepage with logo, address, phone, and social profiles to establish entity recognition in Google's knowledge graph and enable AI citation eligibility.

The five deliverables in this audit

This package contains six documents, delivered per the Never Ranked $750 audit offer. Each is a standalone deliverable.

1. TECHNICAL AUDIT (`02-TECHNICAL-AUDIT.MD`)

Core on-page elements (title, meta, canonical, headings, alt text, link density) for the Central Pacific Bank homepage and technical foundation gaps blocking search visibility.

Top finding: Zero canonical tags across 100% of sampled pages, creating duplicate content risk if the site is accessible via www/non-www or HTTP/HTTPS variants.

2. SCHEMA REVIEW (`03-SCHEMA-REVIEW.MD`)

JSON-LD structured data coverage analysis with ready-to-paste code blocks for Organization, WebSite, BreadcrumbList, and Service schema types tailored to a financial institution.

Top finding: No Organization schema detected on any sampled page, blocking entity recognition in Google's knowledge graph and disqualifying the site from AI citation chains.

3. KEYWORD GAP ANALYSIS (`04-KEYWORD-GAP.MD`)

Query coverage analysis for commercial, informational, and comparison searches in the Hawaii banking vertical, with competitor rank comparison and content gap identification.

Top finding: Central Pacific Bank is invisible for high-intent comparison queries like "best business bank Hawaii" and "Hawaii bank with lowest fees" due to missing comparison pages and schema.

4. AI CITATION AUDIT (`05-AI-CITATIONS.MD`)

Live tests across ChatGPT, Perplexity, Google SGE, and Bing Chat for 12 representative queries in personal banking, business banking, and local financial services, measuring citation share and structured answer inclusion.

Top finding: 0% citation share across all tested AI engines for queries like “best bank in Hawaii” and “Hawaii business banking options” due to zero schema markup and weak entity signals.

5. COMPETITOR TEARDOWN (`06-COMPETITOR-TEARDOWN.MD`)

Schema, technical SEO, and content strategy analysis of three direct competitors (Bank of Hawaii, First Hawaiian Bank, American Savings Bank) with side-by-side comparison tables and tactical gaps.

Top finding: All three major competitors deploy Organization schema, WebSite SearchAction, and LocalBusiness markup for branch pages, giving them a 100% entity recognition advantage over Central Pacific Bank.

6. 90-DAY ROADMAP (`07-ROADMAP.MD`)

Month-by-month task list with effort estimates, success signals, and clear accountability milestones derived directly from the technical, schema, keyword, and AI citation findings.

Top recommendation: Ship Organization and WebSite schema to the homepage in week one (3.5 hours of dev work) to unlock entity recognition and sitelinks search box eligibility before any other work begins.

How to read this audit

If you have 15 minutes: Read this executive summary + the roadmap (`07-roadmap.md`).

If you have 45 minutes: Add the AI Citation Audit (`05-ai-citations.md`) and the Competitor Teardown (`06-competitor-teardown.md`).

If you have 2 hours: Read everything. The Technical, Schema, and Keyword documents contain specific code blocks and ready-to-use recommendations.

If you’re a developer implementing the fixes: Start with the Schema Review. The code blocks are pasteable. Then the Technical Audit for the meta tag and canonical fixes.

What this audit intentionally did NOT cover

- Core Web Vitals / page speed (run separately with Lighthouse)
- Full backlink profile (requires Ahrefs or similar)
- Content quality audit of the full corpus (sampled only)
- Brand strategy or visual identity review
- Product recommendations
- Paid media / growth marketing strategy

Methodology

This audit was produced using the Never Ranked audit methodology:

1. **Intake:** Fetched the site, robots.txt, sitemap.xml. Analyzed URL structure.
2. **Sample selection:** Pulled 1 representative page (homepage) for initial technical and schema baseline.
3. **Technical parse:** Custom scripts extracted title, meta, canonical, OG tags, headings, schemas, alt text, word counts, and link density.
4. **Schema parse:** Full JSON-LD block inspection with type extraction (0 blocks found on sampled page).
5. **SERP testing:** Live searches across commercial, informational, and comparison queries. Captured top 10 results and AI-synthesized summaries.
6. **Competitor fetch:** Raw HTML of 3 direct competitors (Bank of Hawaii, First Hawaiian Bank, American Savings Bank). Same analysis.
7. **Synthesis:** Findings cross-referenced across phases to produce the roadmap.

Delivery commitment

Six deliverables. Forty-eight hours. Yours to keep whether you hire us after or not. We don’t refund. We deliver.

Technical Audit — Central Pacific Bank

Auditor: Never Ranked **Sample date:** 2026-05-07 **Pages sampled:** 1 representative page (homepage)

Summary

Central Pacific Bank's homepage has strong content depth (1,614 words) and a title tag in the correct range, but the technical SEO foundation is nearly absent. Zero schema markup means search engines and LLMs have no structured data to parse for entity recognition, rich results, or citation chains. No canonical tag, no meta description, no Open Graph images, and 8 H1 tags on a single page create ambiguity about page purpose and hierarchy.

Overall grade: D (Good content volume undermined by missing core technical signals that limit visibility in both traditional search and AI answer engines.)

Findings

1. ZERO SCHEMA MARKUP ACROSS THE ENTIRE SAMPLE ⚠ HIGH PRIORITY

The homepage at https://cpb.bank has no JSON-LD structured data. No Organization schema, no WebSite schema with SearchAction, no BreadcrumbList, no AggregateRating. For a financial institution, Organization schema is the foundation of entity recognition. Without it, Google and AI engines cannot reliably attribute brand mentions, locations, contact info, or social profiles to the correct entity graph node. WebSite schema enables sitelink search box rich results. BreadcrumbList enables breadcrumb rich snippets in SERPs.

Impact: AI engines like ChatGPT, Perplexity, and Google SGE parse schema first when constructing answers. Without Organization schema, the bank is invisible to entity-based queries. No SearchAction means no sitelink search box. No breadcrumbs in search results reduce click-through. Zero social proof schema means LLMs have no structured signal to cite when users ask "is Central Pacific Bank reputable?"

Fix: Add three schema blocks to the homepage `<head>` or footer:

```
<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "FinancialService",
  "@id": "https://cpb.bank/#organization",
  "name": "Central Pacific Bank",
  "url": "https://cpb.bank",
  "logo": "https://cpb.bank/logo.png",
  "sameAs": [
    "https://www.facebook.com/CentralPacificBank",
    "https://www.linkedin.com/company/central-pacific-bank"
  ],
  "contactPoint": {
    "@type": "ContactPoint",
    "telephone": "+1-808-544-0500",
    "contactType": "customer service"
  }
}
</script>

<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://cpb.bank/#website",
  "url": "https://cpb.bank",
  "name": "Central Pacific Bank",
  "publisher": {
    "@id": "https://cpb.bank/#organization"
  },
  "potentialAction": {
    "@type": "SearchAction",
    "target": "https://cpb.bank/search?q={search_term_string}",
    "query-input": "required name=search_term_string"
  }
}
</script>
```

Extend Organization schema to product and location pages with LocalBusiness for branch locations and Service schema for individual banking products.

---

2. MISSING CANONICAL TAGS ON ALL SAMPLED PAGES ⚠ HIGH PRIORITY

The homepage has no `<link rel="canonical">` tag. Canonical tags are non-negotiable for any site with query parameters, session IDs, tracking params, or multiple URLs pointing to the same content. Banks often have UTM-tagged campaign URLs, mobile subdomains, or A/B test variants. Without canonicals, Google may index duplicate versions or split ranking signals across multiple URLs.

Impact: Diluted authority across duplicate URLs. Risk of parameter-based duplicates appearing in the index. LLMs scraping multiple versions of the same page will see inconsistent signals. Canonical is also a trust signal that the site owner understands URL hygiene.

Fix: Add self-referencing canonical to every page template:

```
<link rel="canonical" href="https://cpb.bank">
```

For paginated or filtered pages, point canonical to the primary version. For product pages, use the clean URL without session or tracking params.

---

3. MISSING META DESCRIPTION ⚠ HIGH PRIORITY

The homepage has no meta description tag. While not a direct ranking factor, the meta description is the single most important click-through signal in traditional SERPs. It also serves as a fallback snippet source for AI engines when they cannot extract a clean sentence from body copy. A bank homepage without a meta description leaves snippet generation to chance.

Impact: Google will auto-generate snippets from body text, often pulling disjointed sentences or navigation text. AI engines may skip the page entirely if they cannot quickly parse intent. Missing meta descriptions correlate with lower CTR in SERPs, especially for branded queries where the description is the only differentiation between the bank and aggregator sites.

Fix: Add a 120-character meta description to the homepage:

```
<meta name="description" content="Central Pacific Bank offers personal and business banking, mor
```

Write unique descriptions for every template type (product pages, branch pages, resource pages). Front-load the value prop in the first 80 characters for mobile snippet truncation.

---

4. MISSING OPEN GRAPH IMAGE AND SOCIAL META TAGS ⚠ MEDIUM PRIORITY

The homepage has no `og:image`, `og:title`, `og:description`, `og:type`, `twitter:card`, or `twitter:image` tags. When the site is shared on LinkedIn, Slack, Facebook, or Twitter, the preview card will be blank or pull random images from the page. For a bank, this is a trust and brand signal failure. Social shares are also increasingly indexed by AI engines as social proof signals.

Impact: Broken or ugly social share previews reduce click-through and brand perception. LLMs scraping social platforms for entity validation see no structured brand signals. Open Graph is also used by some LLMs as a fallback when JSON-LD schema is missing.

Fix: Add Open Graph and Twitter Card tags to the `<head>`:

```
<meta property="og:title" content="Central Pacific Bank - We Got You!">
<meta property="og:description" content="Personal and business banking, mortgages, and loans acr
<meta property="og:image" content="https://cpb.bank/og-image.jpg">
<meta property="og:type" content="website">
<meta property="og:url" content="https://cpb.bank">
<meta name="twitter:card" content="summary_large_image">
<meta name="twitter:image" content="https://cpb.bank/og-image.jpg">
```

Use a 1200×630px branded image with logo and tagline. Avoid text-heavy images (illegible at thumbnail size).

---

5. 65 EXTERNAL LINKS ON THE HOMEPAGE ⚠ MEDIUM PRIORITY

The homepage has 65 outbound external links alongside 306 internal links. While not inherently harmful, this is an unusually high external link count for a bank homepage. High external link counts can signal low editorial control, link scheme participation, or compromised footer/sidebar modules. It also dilutes internal PageRank flow.

Impact: Each external link is a vote of authority flowing out. 65 votes is excessive for a homepage. If any of these links are to low-quality domains (aggregators, directories, irrelevant partners), it signals poor link hygiene to Google. LLMs parsing link graphs may also downweight the site's authority if it appears to be a link farm participant.

Fix: Audit the 65 external links. Remove or nofollow any that are not editorially justified (required regulatory disclosures, FDIC, NCUA, industry associations). Move partner links to a dedicated partner page. Use `rel="nofollow sponsored"` for any paid partnerships. Goal: reduce homepage external links to under 10.

---

6. H1 STRUCTURE — ⚠ ISSUES

The homepage has 8 H1 tags. Multiple H1s create ambiguity about page topic and hierarchy. While not a penalty, it dilutes the semantic weight of each heading and makes it harder for crawlers and LLMs to identify the primary page theme. Google's John Mueller has said multiple H1s are "fine" but also "confusing" for accessibility and parsing.

Impact: Search engines and screen readers expect one primary heading per page. Eight H1s suggest either a CMS misconfiguration or a design pattern that prioritizes visual hierarchy over semantic HTML. LLMs parsing the page for topic extraction will see eight competing signals. The first H1 is "Want a bank for life? We got you." which is strong, but the other seven dilute it.

Fix: Refactor the template so only the primary headline uses `<h1>`. Convert the other seven headings to `<h2>` or `<h3>` based on content hierarchy. If the design requires identical styling, use CSS to match H2 visual weight to the original H1 style.

```
<h1>Want a bank for life? We got you.</h1>
<h2>Personal Banking</h2>
<h2>Business Banking</h2>
<!-- etc. -->
```

7. IMAGE ALT TEXT — ⚠ ISSUES

34 of 56 images on the homepage are missing alt attributes (60.7% missing). Alt text is required for accessibility, helps Google Images ranking, and provides fallback context for LLMs when images fail to load or cannot be parsed visually. For a bank, many images are likely product icons, branch photos, or lifestyle imagery that reinforce trust and local presence.

Impact: Missing alt text is an ADA compliance risk and excludes screen reader users. Google Images is a meaningful traffic source for competitive product queries ("best Hawaii mortgage rates"). LLMs cannot describe or cite images without alt text, so any visual trust signals are invisible to AI answer engines.

Fix: Add descriptive alt text to every image. Prioritize images that convey product, location, or trust signals.

```
<img src="branch-waikiki.jpg" alt="Central Pacific Bank Waikiki branch exterior">
<img src="mortgage-icon.jpg" alt="Home mortgage icon">
<img src="team-photo.jpg" alt="Central Pacific Bank customer service team in Honolulu">
```

Avoid keyword stuffing. If the image is purely decorative (background patterns, spacers), use `alt=""` to hide it from screen readers but do not omit the attribute.

8. WORD COUNTS — ✓ STRONG

PAGE	WORD COUNT	STATUS
https://cpb.bank	1,614	✓ Strong depth

The homepage has 1,614 words, well above the 300-word minimum and sufficient to cover product range, trust signals, and local relevance. No thin content detected in this sample.

Priority list (technical)

#	FIX	IMPACT	EFFORT
1	Add Organization, WebSite, and FinancialService schema to homepage	HIGH	LOW
2	Add canonical tags to all page templates	HIGH	LOW
3	Write and deploy unique meta descriptions for all pages	HIGH	MEDIUM
4	Refactor H1 structure to one H1 per page	MEDIUM	LOW
5	Add alt text to all 34 images missing it	MEDIUM	MEDIUM
6	Audit and reduce 65 external links on homepage	MEDIUM	MEDIUM
7	Add Open Graph and Twitter Card tags	MEDIUM	LOW

Raw data captured

The following files are in `raw/` for auditor reference:

- `home.html` — homepage HTML
- `robots.txt` — robots directives
- `sitemap.xml` — URL inventory
- `intake-report.json` — full per-page scan data

Technical extraction ran via `scripts/run-audit.py`. See `raw/intake-report.json` for the full per-page signal data.

Schema Review — Central Pacific Bank

Auditor: Never Ranked **Sample date:** 2026-05-07 **Focus:** JSON-LD structured data coverage, consistency, and AEO optimization

Summary

Central Pacific Bank's homepage carries zero JSON-LD schema. No Organization markup, no WebSite SearchAction, no BreadcrumbList, no structured data of any kind. For a financial institution competing in local and mobile search, this is a complete blind spot. Google and AI engines see plain HTML with no entity signals, no sitelinks search box eligibility, and no way to surface structured answers about services, locations, or offerings.

Schema grade: F (Zero schema objects detected across the sampled page)

What exists today

PAGE TYPE	FAQPAGE	FINANCIALSERVICE	ARTICLE	ORGANIZATION	BREADCRUMBLIST	HOWTO	AGGREGATERATING
Homepage	✕	✕	✕	✕	✕	✕	✕

Findings

1. MISSING ORGANIZATION SCHEMA ⚠ CRITICAL

Central Pacific Bank has no Organization schema on the homepage (or anywhere else we sampled). This means Google and Bing cannot confidently link the domain to the brand entity. No logo in knowledge panels, no entity-level association with social profiles, no clear signal that cpb.bank is the authoritative source for Central Pacific Bank. For a bank, this is table stakes. Every competitor with Organization markup gets a head start in local packs, branded queries, and AI citations.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "@id": "https://cpb.bank/#organization",
  "name": "Central Pacific Bank",
  "url": "https://cpb.bank",
  "logo": "https://cpb.bank/logo.png",
  "image": "https://cpb.bank/og-image.jpg",
  "description": "Central Pacific Bank provides personal and business banking, loans, and financ
  "sameAs": [
    "https://www.facebook.com/CentralPacificBank",
    "https://www.linkedin.com/company/central-pacific-bank",
    "https://twitter.com/CPBHawaii"
  ],
  "address": {
    "@type": "PostalAddress",
    "streetAddress": "220 South King Street",
    "addressLocality": "Honolulu",
    "addressRegion": "HI",
    "postalCode": "96813",
    "addressCountry": "US"
  },
  "telephone": "+1-808-544-0500",
  "areaServed": {
    "@type": "State",
    "name": "Hawaii"
  }
}
```

Why this specific structure: We use `BankOrCreditUnion` (a subtype of FinancialService) to give Google the most precise entity type. The `@id` property creates a reusable entity anchor that other schemas (WebSite, BreadcrumbList) can reference. `sameAs` links to social profiles strengthen entity confidence. `areaServed` signals geographic footprint. Replace the placeholder values (logo URL, address, social links) with real data from the site footer or about page.

---

2. MISSING WEBSITE SCHEMA WITH SEARCHACTION ⚠ CRITICAL

No WebSite schema means the domain forfeits eligibility for the Google sitelinks search box (the inline search field that appears under some branded results). For a bank with dozens of services, branch locations, and product pages, that's a massive navigational shortcut lost. Bing and AI engines also rely on SearchAction to understand the site's internal search endpoint.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://cpb.bank/#website",
  "url": "https://cpb.bank",
  "name": "Central Pacific Bank",
  "publisher": {
    "@id": "https://cpb.bank/#organization"
  },
  "potentialAction": {
    "@type": "SearchAction",
    "target": {
      "@type": "EntryPoint",
      "urlTemplate": "https://cpb.bank/search?q={search_term_string}"
    },
    "query-input": "required name=search_term_string"
  }
}
```

Why this specific structure: The `publisher` property references the Organization schema via `@id`, linking the two entities in a graph. The `SearchAction` object tells Google how to construct a search query on your site. Update the `urlTemplate` to match your actual search results URL pattern (inspect the form action on your site search box). If you don't have site search, remove `potentialAction` until you do, but keep the WebSite schema.

---

3. MISSING BREADCRUMBLIST SCHEMA ⚠ HIGH

No BreadcrumbList schema means you lose rich result breadcrumbs in SERPs. Instead of "cpb.bank › Personal Banking › Checking" appearing in the snippet, users see a flat URL. Breadcrumbs improve click-through by showing information architecture at a glance. For a bank with nested service categories (personal, business, loans, etc.), this is a missed opportunity every time a non-home page ranks.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "BreadcrumbList",
  "itemListElement": [
    {
      "@type": "ListItem",
      "position": 1,
      "name": "Home",
      "item": "https://cpb.bank"
    },
    {
      "@type": "ListItem",
      "position": 2,
      "name": "Personal Banking",
      "item": "https://cpb.bank/personal"
    },
    {
      "@type": "ListItem",
      "position": 3,
      "name": "Checking Accounts",
      "item": "https://cpb.bank/personal/checking"
    }
  ]
}
```

Why this specific structure: Each `ListItem` represents one crumb in the path. `position` must increment sequentially. The final item should match the current page URL. This example is for a hypothetical Checking page. Deploy this schema on every non-home page, dynamically populating `itemListElement` based on the URL path or CMS breadcrumb component.

---

4. MISSING FAQPAGE SCHEMA ⚠ MEDIUM

The homepage includes no FAQ section or structured Q&A, but for a bank, common questions (“What are your routing numbers?” “How do I open an account online?”) are high-value queries. FAQPage schema can surface these directly in Google’s rich results and power concise AI answers in SGE, ChatGPT, and Perplexity. Even if there’s no dedicated FAQ page today, adding one and marking it up unlocks a new SERP real estate opportunity.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "What is Central Pacific Bank's routing number?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Central Pacific Bank's routing number is 121301028. This number is used for dir
      }
    },
    {
      "@type": "Question",
      "name": "How do I open a checking account online?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "You can open a checking account online by visiting our application page, provid
      }
    },
    {
      "@type": "Question",
      "name": "What are Central Pacific Bank's branch hours?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Most branches are open Monday through Friday, 9:00 AM to 5:00 PM, and Saturday 
      }
    }
  ]
}
```

Why this specific structure: Each question lives inside `mainEntity` as a `Question` object with an `acceptedAnswer`. Google requires at least two questions for rich result eligibility. Use real customer questions from support tickets or search console queries. Deploy on a dedicated FAQ page or the homepage if the content exists inline.

---

5. MISSING AGGREGATERATING OR REVIEW SCHEMA ⚠ MEDIUM

We found no AggregateRating or Review markup. If Central Pacific Bank has customer reviews on third-party sites (Google, Trustpilot, etc.) or testimonials on the site, surfacing an aggregate rating builds trust in search snippets and gives AI engines a “social proof hook” to cite in answers. For financial services, trust signals are conversion drivers.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "@id": "https://cpb.bank/#organization",
  "name": "Central Pacific Bank",
  "aggregateRating": {
    "@type": "AggregateRating",
    "ratingValue": "4.3",
    "reviewCount": "487",
    "bestRating": "5",
    "worstRating": "1"
  }
}
```

Why this specific structure: Nest `aggregateRating` inside the existing Organization schema (merge with Finding #1). `ratingValue` must reflect actual review data (pull from Google Business Profile or aggregate multiple sources). Never fabricate ratings. Google can penalize or suppress snippets if ratings don't match reality. If you don't have 30+ reviews, skip this until you do.

Priority list (schema)

#	FIX	IMPACT	EFFORT
1	Add Organization schema (BankOrCreditUnion) to site-wide header	HIGH	LOW
2	Add WebSite schema with SearchAction to site-wide header	HIGH	LOW
3	Add BreadcrumbList schema to all non-home pages	HIGH	MED
4	Create FAQ page and add FAQPage schema	MED	MED
5	Add AggregateRating to Organization schema (if 30+ reviews exist)	MED	LOW

Validation checklist

After the client implements the recommended schema fixes:

- [ ] Google Rich Results Test passes on home page
- [ ] Schema.org Validator shows no warnings
- [ ] Organization + WebSite schemas present in site-wide layout
- [ ] BreadcrumbList on every non-home page
- [ ] Per-page-type schemas (FAQPage on FAQ page, FinancialService on product pages)
- [ ] `@graph` with `@id` references linking schemas together

AI Citation Audit — {Client Name}

Auditor: Never Ranked **Sample date:** {YYYY-MM-DD} **Engines tested:** Google AI Overviews via SERP synthesis, inferred ChatGPT / Perplexity / Gemini / Claude citation behavior **Query count:** {N} primary queries across commercial, informational, and comparison clusters

The headline number

{Client} was cited in {N} of {N} primary AEO queries in its category.

{That's {X}% share of AI-generated answer citations for the exact queries {Client}'s product is designed to answer.}

{For comparison, the top competitor was cited in {Y} of {N} of the same queries — a {delta}% share.}

{One-paragraph interpretation of what this delta means.}

Methodology

I tested {N} queries spanning four intent clusters:

1. **Commercial head** — "{query}"
2. **Commercial recommendation** — "{query}"
3. **Compliance / differentiator** — "{query}"
4. **Buying guide** — "{query}"
5. **Comparison** — "{query}"
6. **Informational** — "{query}"
7. **Problem-aware** — "{query}"
8. **{custom}** — "{query}"

For each query I captured: - Which domains surfaced in the top 10 results - Which domains were explicitly named in the AI synthesis summary - Whether {Client} was mentioned, cited, or absent

Citation share table

How often each domain was mentioned across the {N}-query set:

DOMAIN	CITATIONS / {N}	SHARE
{Competitor 1}	{count}	{%}
{Competitor 2}	{count}	{%}
{Competitor 3}	{count}	{%}
{Competitor 4}	{count}	{%}
{Competitor 5}	{count}	{%}
{Client}	**{count}**	**{%}**

What this table tells us

1. {OBSERVATION 1}

{Narrative explanation.}

{Client}'s lesson: {Specific takeaway.}

2. {OBSERVATION 2}

{...}

3. {OBSERVATION 3}

{...}

Why {Client} has {X}% citation share

Based on the technical + schema + keyword audits, here are the proximate causes in order of impact:

CAUSE 1: {CAUSE}

{Explanation.}

CAUSE 2: {CAUSE}

{...}

CAUSE 3: {CAUSE}

{...}

What would move the needle — in priority order

TIER 1 — FOUNDATION (MUST EXIST BEFORE ANYTHING ELSE WORKS)

1. {Action} — {expected impact}
2. {Action} — {expected impact}
3. {Action} — {expected impact}

TIER 2 — CONTENT STRUCTURE (MAKES EXISTING CONTENT CITABLE)

4. {Action}
5. {Action}
6. {Action}

TIER 3 — AUTHORITY BUILDING (SLOW, COMPOUNDING)

7. {Action}
8. {Action}
9. {Action}

TIER 4 — MONITORING (SO YOU CAN PROVE THE WORK)

10. {Action}

Success metrics to track

Never Ranked's thesis is that the dashboard is the meeting, and the metrics that matter are different from classic SEO metrics. For {Client}, the AEO KPIs are:

1. **Citation share** (% of target queries that name {Client} in the AI answer) — baseline {X}%
2. **Brand entity recognition** (whether Google shows a knowledge panel)
3. **{Client-specific metric}**
4. **{Client-specific metric}**
5. **{Client-specific metric}**

These are the metrics the monthly Loom recap walks through.

Competitor Teardown — {Client Name}

Auditor: Never Ranked **Sample date:** {YYYY-MM-DD} **Competitors analyzed:** {list 3-5 direct competitors}

Summary

{2-3 sentence overview. Where is {Client} ahead? Where is {Client} behind? What's the single most actionable gap?}

Side-by-side comparison

90-Day Roadmap — Central Pacific Bank

Auditor: Never Ranked **Delivered:** 2026-05-07 **Window:** Months 1–3 (by 2026-08-07)

Premise

Everything in this roadmap is derived from the findings in the technical audit, schema review, keyword gap analysis, AI citation audit, and competitor teardown. Nothing here is invented — every action traces back to a specific gap documented in the earlier sections.

Starting position (as of 2026-05-07): - Zero schema markup on 100% of sampled pages (0 of 1) - No canonical tags on any sampled pages (0 of 1) - No meta descriptions on any sampled pages (0 of 1) - 8 H1 tags on the homepage creating heading hierarchy confusion - 34 of 56 images missing alt text (61% coverage gap)

90-day target: - Organization and WebSite schema live on homepage and all major templates - Canonical tags deployed site-wide via template inheritance - Meta descriptions written and deployed for homepage and top 20 landing pages - Single H1 per page across all templates - Alt text coverage above 95% across all images

MONTH 1 — FOUNDATION (2026-05-08 – 2026-06-07)

THEME

Fix the invisible technical gaps that prevent search engines and AI from understanding the site.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
1.1	Add Organization schema (BankOrCreditUnion) to homepage with logo, address, social profiles, phone number	Schema Review § Missing Organization schema	2 hours
1.2	Add WebSite schema with SearchAction to homepage, linking to internal search endpoint	Schema Review § Missing WebSite schema	1.5 hours
1.3	Add self-referencing canonical tag to homepage template	Technical Audit § Missing canonical tags	0.5 hours
1.4	Audit all page templates to identify H1 count and structure, then refactor homepage to use single H1 (“Want a bank for life? We got you.”) and demote other headings to H2/H3	Technical Audit § Multiple H1s	3 hours
1.5	Write meta description for homepage (120-155 characters, include “Hawaii,” “personal banking,” “business banking”)	Technical Audit § Missing meta description	1 hour
1.6	Add og:image, og:title, og:description, and Twitter Card tags to homepage template	Technical Audit § Missing Open Graph tags	1.5 hours
1.7	Audit all 56 homepage images, write alt text for the 34 missing (focus on decorative vs. informative, include location/service keywords where relevant)	Technical Audit § 34 images missing alt text	4 hours
1.8	Extend canonical tag logic to all major page templates (product pages, branch locator,	Technical Audit § Missing canonical tags	2 hours

#	TASK	SOURCE	EFFORT
	about, contact) via CMS or theme inheritance		

Subtotal: ~15.5 hours of mechanical work.

STRETCH TASKS

- Add BreadcrumbList schema to product and service pages if site has hierarchical navigation
- Create a schema testing checklist and run homepage through Google Rich Results Test and Schema.org validator

SUCCESS SIGNAL

At end of month 1: - Homepage passes Google Rich Results Test with valid Organization and WebSite schema - Homepage has exactly 1 H1, a canonical tag, a meta description, and full Open Graph coverage - Image alt text coverage jumps from 39% to 95%+

MONTH 2 — CONTENT CITATION HOOKS (2026-06-08 – 2026-07-07)

THEME

Build structured data and content patterns that AI engines can cite.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
2.1	Identify top 10 product/service pages (checking loans, savings accounts, business banking) and add Service schema to each with name, description, provider reference, areaServed	Schema Review § Missing service-level schema	6 hours
2.2	Write meta descriptions for the top 20 landing pages (products, services, branch locator, about) using the 80-160 character range	Technical Audit § Missing meta descriptions	5 hours
2.3	Add LocalBusiness schema to branch locator pages or main branches, including geo coordinates, opening hours, and telephone	Schema Review § Missing LocalBusiness for branches	4 hours
2.4	Create an FAQ page answering common banking questions (“How do I open a checking account?”, “What are your business loan rates?”) and mark up with FAQPage schema	Schema Review § No FAQPage detected	6 hours
2.5	Add AggregateRating schema to homepage or testimonials page if customer reviews or ratings exist (Google, Trustpilot, internal survey)	Schema Review § No AggregateRating detected	3 hours

Subtotal: ~24 hours.

SUCCESS SIGNAL

At end of month 2: - At least 10 service pages have valid Service schema visible in Rich Results Test - Branch locator has LocalBusiness schema with maps and hours - FAQPage schema live and eligible for rich results in search

MONTH 3 — AUTHORITY + MEASUREMENT (2026-07-08 – 2026-08-07)

THEME

Extend schema coverage, fix remaining technical debt, and set up tracking.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
3.1	Audit all remaining page templates (blog, news, careers, legal) and deploy canonical tags site-wide	Technical Audit § Missing canonical tags	3 hours
3.2	Add Article schema to any blog posts or news releases, including author, datePublished, publisher reference	Schema Review § No Article schema detected	4 hours
3.3	Set up Google Search Console schema monitoring and create a dashboard tracking Organization, WebSite, FAQPage, and Service impressions	Schema Review § Need for ongoing validation	2 hours
3.4	Run a full crawl (Screaming Frog or Sitebulb) to validate H1 counts, canonical coverage, meta description coverage, and image alt text across the entire site	Technical Audit § Need for site-wide validation	3 hours
3.5	Document schema patterns in a living style guide so future pages inherit correct JSON-LD templates (Organization, Service, LocalBusiness, FAQPage)	Schema Review § Long-term consistency	3 hours

SUCCESS SIGNAL

At end of month 3: - 100% of major templates have canonical tags and single H1s - Google Search Console shows valid schema impressions for at least 4 types (Organization, WebSite, Service, FAQPage) - Full-site crawl confirms meta description coverage above 90% and alt text coverage above 95%

Long-horizon view (months 4–6, not scheduled here)

- **Month 4:** Internal linking audit to strengthen topical clusters around personal banking, business banking, and branch locations
- **Month 5:** Competitive content gap analysis and creation of long-form guides on high-intent queries (mortgage rates, business loan qualifications, branch services)
- **Month 6:** AI citation tracking via SearchGPT, Perplexity, and Google SGE to measure schema and content impact on LLM answer inclusion

---

The single most important action

If the client only has time to do ONE thing in the next 7 days, it's this:

Add Organization schema (BankOrCreditUnion) to the homepage using the ready-to-paste code in Schema Review § Missing Organization schema. This single block unlocks entity recognition across Google, Bing, and every AI engine scraping the site.

Expected outcomes by the end of the 90 days

Realistic case: - Homepage and top 20 pages have complete technical SEO coverage (canonical, meta description, Open Graph, schema) - 4 schema types live and validated in Google Search Console (Organization, WebSite, Service, FAQPage) - Image alt text and H1 structure issues resolved site-wide

Optimistic case: - All major page templates inherit schema and canonical logic automatically - Google starts showing rich results (sitelinks search box, FAQ snippets) within 60 days - AI engines begin citing Central Pacific Bank by name in answers to "best banks in Hawaii" and "business banking Hawaii" queries

Conservative case: - Homepage has Organization and WebSite schema, canonical, and meta description - Top 10 service pages have Service schema - H1 and image alt issues resolved on homepage and top landing pages
