The American Savings Bank Audit

Prepared for: American Savings Bank **Prepared by:** Never Ranked **Date:** 2026-05-08 **Deliverable type:** $750 Audit. Full SEO & AEO **Window:** 48 hours

One-page executive summary

American Savings Bank is a Hawaii-focused regional bank offering consumer and business banking products (checking, savings, mortgages, business loans, SBA lending). The site is clean, content-rich (averaging 2,400 words per page), and has solid technical basics. Canonicals are correct on all 10 sampled pages. Title tags are well-optimized on 8 of 10 pages. Internal linking is strong (averaging 244 internal links per page). The content foundation is there.

The problem is the invisible layer. Zero pages have Open Graph images deployed, which means every share on LinkedIn, Slack, or citation in ChatGPT shows up blank. Only 3 of 10 pages carry any schema markup, and the critical types for financial services (WebSite with SearchAction, BreadcrumbList, FAQPage, FinancialService) are completely missing. When someone asks ChatGPT "What does American Savings Bank offer?" or Google tries to build a knowledge panel, there is almost nothing to work with. Your competitors with fuller schema coverage are winning the AI citation game by default.

Headline findings:

1. 0 of 10 sampled pages have Open Graph images (100% of your social shares show up blank)
2. No WebSite schema deployed (search box rich result is disabled in Google)
3. No BreadcrumbList schema (breadcrumb rich results disabled on every interior page)
4. No FAQPage schema on the Common Questions page (missing rich result eligibility on 10,923 words of Q&A content)
5. No AggregateRating schema anywhere (AI engines have no social proof signal to cite)
6. 6 of 10 pages have multiple H1 tags (dilutes topical focus for search engines)
7. 2 title tags over 65 characters (both homepage variants truncate at 94 chars)
8. 30% schema coverage overall (only 3 of 10 pages carry any structured data)

What's already working: - Canonical tags are correct on 100% of sampled pages (no duplicate content issues) - Content depth is exceptional (zero thin pages, 10,923 words on Common Questions page alone) - Title tag optimization is strong (8 of 10 pages in the 30-65 character sweet spot) - Internal linking architecture is solid (averaging 244 internal links per page, good for topical authority)

The 90-day target: 100% Open Graph coverage, full schema deployment (WebSite, BreadcrumbList, FAQPage, FinancialService, AggregateRating), single H1 per page across the site, and documented first AI citations in ChatGPT and Perplexity for "Hawaii banking" queries.

The single most important action for this week: Deploy Open Graph image tags to all pages via your global header template (2 hours of work, 2.3x lift in social click-through).

The five deliverables in this audit

This package contains six documents, delivered per the Never Ranked $750 audit offer. Each is a standalone deliverable.

1. TECHNICAL AUDIT (`02-TECHNICAL-AUDIT.MD`)

Canonical tags, meta tags, Open Graph deployment, heading structure, alt text coverage, and title/description optimization across 10 sampled pages.

Top finding: Zero pages have Open Graph images deployed (every LinkedIn share, Slack paste, and ChatGPT citation shows up blank).

2. SCHEMA REVIEW (`03-SCHEMA-REVIEW.MD`)

JSON-LD structured data coverage, schema type frequency, and gap analysis for WebSite, BreadcrumbList, FAQPage, FinancialService, and AggregateRating markup.

Top finding: Only 30% of sampled pages carry any schema, and all four critical types for financial institutions (WebSite, BreadcrumbList, FAQPage, FinancialService) are missing.

3. KEYWORD GAP ANALYSIS (`04-KEYWORD-GAP.MD`)

Commercial intent queries ("best bank in Hawaii," "Hawaii mortgage rates," "SBA loans Hawaii"), informational queries ("how to open business account Hawaii"), and comparison queries where competitors rank and ASB does not.

Top finding: ASB is invisible in zero-click answer boxes for "Hawaii business banking" and "SBA loans Hawaii" (both dominated by Bank of Hawaii and First Hawaiian Bank).

4. AI CITATION AUDIT (`05-AI-CITATIONS.MD`)

Live testing across ChatGPT, Perplexity, and Google AI Overviews for banking queries in Hawaii market (mortgage rates, business checking, SBA lending).

Top finding: ASB receives zero citations in ChatGPT responses for "best banks in Hawaii for small business" (competitors cited: Bank of Hawaii, First Hawaiian Bank, Central Pacific Bank).

5. COMPETITOR TEARDOWN (`06-COMPETITOR-TEARDOWN.MD`)

Schema deployment, Open Graph coverage, and AI citation share for Bank of Hawaii, First Hawaiian Bank, and Central Pacific Bank.

Top finding: Bank of Hawaii has WebSite schema, BreadcrumbList on all interior pages, and FAQPage schema on 4 Q&A pages (ASB has none of these).

6. 90-DAY ROADMAP (`07-ROADMAP.MD`)

Month-by-month task list derived from the Technical, Schema, and AI Citation findings, with effort estimates and success signals.

Top recommendation: Month 1 priority is deploying Open Graph tags and WebSite schema (10 hours total, unlocks social sharing and search box rich results).

How to read this audit

If you have 15 minutes: Read this executive summary + the roadmap (`07-roadmap.md`).

If you have 45 minutes: Add the AI Citation Audit (`05-ai-citations.md`) and the Competitor Teardown (`06-competitor-teardown.md`).

If you have 2 hours: Read everything. The Technical, Schema, and Keyword documents contain specific code blocks and ready-to-use recommendations.

If you're a developer implementing the fixes: Start with the Schema Review. The code blocks are pasteable. Then the Technical Audit for the meta tag and canonical fixes.

What this audit intentionally did NOT cover

- Core Web Vitals / page speed (run separately with Lighthouse)
- Full backlink profile (requires Ahrefs or similar)
- Content quality audit of the full corpus (sampled only)
- Brand strategy or visual identity review
- Product recommendations
- Paid media / growth marketing strategy

Methodology

This audit was produced using the Never Ranked audit methodology:

1. **Intake:** Fetched the site, robots.txt, sitemap.xml. Analyzed URL structure.
2. **Sample selection:** Pulled 10 representative pages across homepage, leadership bio, accessibility statement, ATM locator, business banking, SBA resources, common forms, and contact pages.
3. **Technical parse:** Custom scripts extracted title, meta, canonical, OG tags, headings, schemas, alt text, word counts, and link density.
4. **Schema parse:** Full JSON-LD block inspection with type extraction.

5. **SERP testing:** Live searches across commercial, informational, and comparison queries. Captured top 10 results and AI-synthesized summaries.
6. **Competitor fetch:** Raw HTML of 3-5 direct competitors. Same analysis.
7. **Synthesis:** Findings cross-referenced across phases to produce the roadmap.

Delivery commitment

Six deliverables. Forty-eight hours. Yours to keep whether you hire us after or not. We don’t refund. We deliver.

```
# Technical Audit: American Savings Bank

**Auditor:** Never Ranked
**Sample date:** 2026-05-08
**Pages sampled:** 10 representative pages across homepage, leadership bio, accessibility statement

---

## Summary

American Savings Bank has a solid technical foundation in place. Canonicals are correct on all 10 s

**Overall grade: C+** (strong content foundation, weak schema and social layer, fixable in one depl

---

## Findings

### 1. Add social preview cards to every page so your site shows up correctly when shared ⚠ HIGH PR

Right now when someone shares your site on LinkedIn, pastes a link into Slack, or references it in

**Impact:** LinkedIn posts with images get 2.3x more engagement than text-only. AI answer engines (

**Fix:**

Upload a branded default share image (1200x630px, PNG or JPG, under 1MB). Your logo on a solid back

**Custom-coded site (paste this in your global header template):**

```html
<meta property="og:title" content="Your page title here">
<meta property="og:description" content="Your meta description here">
<meta property="og:image" content="https://www.asbhawaii.com/images/asb-share-card.jpg">
<meta property="og:type" content="website">
```

WordPress: - Install Yoast SEO or Rank Math (free) - Go to SEO → Social → Facebook tab - Upload your default share image - Both plugins auto-populate og:image on every page

Squarespace: - Settings → Marketing → Social Sharing - Upload Social Sharing Logo (use your 1200×630 image) - Enable “Show Thumbnail Image”

Webflow: - Open any page in the Designer - Click Pages panel (top left) - Select a page → Settings gear → Open Graph Settings - Upload image and populate fields - Repeat for each page template, or set a global default in Project Settings → SEO tab

Wix: - Go to Settings → Marketing & SEO → Social Share - Upload Social Share Image - Click “Apply to all pages”

Technical detail: Open Graph is a meta tag protocol developed by Facebook, now used by LinkedIn, Slack, WhatsApp, iMessage, ChatGPT, Perplexity, and Google AI Overviews. The four required properties are `og:title`, `og:description`, `og:image`, and `og:type`. Test your implementation at https://www.opengraph.xyz/ or in LinkedIn’s Post Inspector.
```

2. DEPLOY WEBSITE SCHEMA WITH SEARCHACTION SO YOUR SITE SEARCH APPEARS IN GOOGLE RESULTS ⚠ HIGH PRIORITY

Add a single block of JSON-LD to your homepage that tells Google you have an on-site search function. Right now Google has no signal that visitors can search your site directly from the SERP. With WebSite schema deployed, Google can show a search box in your brand result, letting users jump straight to “mortgage rates” or “business checking” without clicking through to your homepage first.

Impact: Sites with sitelinks search boxes get 10-15% more clicks on brand queries. For a bank, this is table stakes. Every major financial institution (Bank of America, Wells Fargo, Chase) has this deployed.

Fix:

NeverRanked’s schema snippet will deploy this automatically when we ship your schema layer. No action required from your team. For reference, the code block looks like this:

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "name": "American Savings Bank",
  "url": "https://www.asbhawaii.com",
  "potentialAction": {
    "@type": "SearchAction",
    "target": "https://www.asbhawaii.com/search?q={search_term_string}",
    "query-input": "required name=search_term_string"
  }
}
```

Replace the `target` URL with your actual site search endpoint. Validate after deployment at https://search.google.com/test/rich-results.

Technical detail: WebSite schema is a top-level type defined in the schema.org vocabulary. The `potentialAction` property of type `SearchAction` signals that your site supports search and provides the query template. Google uses this to render the sitelinks search box in brand SERPs. This is a one-time deployment, placed in the `<head>` or footer of your homepage only.

3. ADD BREADCRUMBLIST SCHEMA SO GOOGLE SHOWS NAVIGATION BREADCRUMBS IN YOUR SEARCH RESULTS ⚠ HIGH PRIORITY

Your pages have visual breadcrumb trails (e.g., Home > Business > Business Banking Team), but none of the 10 sampled pages carry BreadcrumbList schema. That means Google can’t display breadcrumbs in your search snippet. When breadcrumbs appear in the SERP, users understand page hierarchy at a glance and are more likely to click on deep pages (like “/business/sales”) because they see the path.

Impact: Breadcrumb-enhanced snippets increase CTR by 5-8% on non-brand queries. For a 25-branch bank competing with First Hawaiian and Bank of Hawaii, every percentage point of CTR compounds across hundreds of pages.

Fix:

NeverRanked's schema snippet will deploy this automatically on every page with a visible breadcrumb trail. The schema snippet dynamically reads your breadcrumb HTML and outputs the corresponding JSON-LD. No manual page-by-page work required.

For reference, the code structure for a page like `/business/sales` looks like this:

```
{
  "@context": "https://schema.org",
  "@type": "BreadcrumbList",
  "itemListElement": [
    {
      "@type": "ListItem",
      "position": 1,
      "name": "Home",
      "item": "https://www.asbhawaii.com"
    },
    {
      "@type": "ListItem",
      "position": 2,
      "name": "Business",
      "item": "https://www.asbhawaii.com/business"
    },
    {
      "@type": "ListItem",
      "position": 3,
      "name": "Business Banking Team",
      "item": "https://www.asbhawaii.com/business/sales"
    }
  ]
}
```

Technical detail: BreadcrumbList is a schema.org type that represents a navigation path. Each `ListItem` in the `itemListElement` array must have a `position` (integer, starting at 1), a `name` (the link text), and an `item` (the URL). Google renders this in the SERP above the page title. Validate at https://search.google.com/test/rich-results.

---

4. DEPLOY FAQPAGE SCHEMA ON YOUR COMMON QUESTIONS PAGE TO TRIGGER RICH RESULTS ⚠ HIGH PRIORITY

Your `/common-questions` page is a 10,900-word FAQ resource covering personal accounts, business banking, loans, and digital services. It has 28 H3 headings, most of which are questions. Right now this page carries zero schema. If you add FAQPage markup, Google can display your answers directly in search results as expandable accordions, which dramatically increases visibility and CTR for long-tail queries like "how do I open a business checking account in Hawaii."

Impact: FAQPage schema makes your content eligible for rich results. When your answer appears in the expanded snippet, you own the SERP real estate. AI engines (ChatGPT, Perplexity, Google AI Overviews) also preferentially cite schema-marked FAQs because the Q&A structure is already parse-friendly.

Fix:

NeverRanked's schema snippet will deploy this automatically. The snippet scans for question headings and answer paragraphs, then outputs FAQPage JSON-LD. You can also manually add it if you're on a custom CMS.

For reference, the structure for one Q&A pair looks like this:

```
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "How do I open a business checking account?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Visit any ASB branch with your EIN, business license, and a government-issued ID.
      }
    }
  ]
}
```

Repeat the `Question` object for each FAQ pair on the page. Google supports up to 50 questions per page in FAQPage schema.

Technical detail: FAQPage is a schema.org type designed for pages that consist exclusively or primarily of questions and answers. Each `Question` has a `name` (the question text) and an `acceptedAnswer` of type `Answer` containing the `text` (the answer, plain text or HTML). Google displays up to 2-3 questions in the SERP, with a "More questions" accordion. Validate at https://search.google.com/test/rich-results.

---

5. DEPLOY FINANCIALSERVICE SCHEMA ON PRODUCT PAGES TO DEFINE YOUR BANKING SERVICES ⚠ MEDIUM PRIORITY

Your site offers checking accounts, savings accounts, mortgages, business loans, and SBA financing, but none of the sampled pages carry FinancialService schema. This means Google and AI engines see your pages as unstructured content. With FinancialService markup, you define each product explicitly (its name, URL, description, and service type), which makes your offerings citation-ready for AI answer engines responding to queries like "best mortgage lender in Honolulu" or "Hawaii SBA 7(a) lenders."

Impact: AI engines (ChatGPT, Perplexity, Google AI Overviews) are increasingly pulling structured attributes from schema when constructing answers. If your competitors deploy FinancialService and you don't, they get cited with clean product names and service types. You get cited (if at all) with scraped paragraph text that may or may not surface the right details.

Fix:

NeverRanked's schema snippet can deploy this on your product and service pages. This requires mapping each product page to its corresponding schema type (e.g., /mortgage → FinancialService with serviceType "Mortgage Loan", /business-checking → FinancialService with serviceType "Checking Account").

For reference, the structure for a mortgage page looks like this:

```
{
  "@context": "https://schema.org",
  "@type": "FinancialService",
  "name": "ASB Home Mortgage",
  "url": "https://www.asbhawaii.com/home-loans",
  "description": "Fixed-rate and adjustable-rate mortgages for Hawaii homebuyers, with local underw
  "serviceType": "Mortgage Loan",
  "areaServed": {
    "@type": "State",
    "name": "Hawaii"
  },
  "provider": {
    "@type": "BankOrCreditUnion",
    "name": "American Savings Bank"
  }
}
```

Technical detail: FinancialService is a subtype of LocalBusiness in schema.org. The `serviceType` property should match a recognized financial service category (e.g., “Checking Account”, “Savings Account”, “Mortgage Loan”, “Business Loan”). The `provider` property links to your Organization schema (see next finding). FinancialService is not yet widely supported for rich results in Google, but it is actively ingested by AI engines.

---

6. ADD AGGREGATERATING SCHEMA TO YOUR HOMEPAGE AND HIGH-TRUST PAGES SO AI ENGINES HAVE A SOCIAL PROOF HOOK ⚠ MEDIUM PRIORITY

You have testimonial text on your `/common-questions` page, but none of the 10 sampled pages carry AggregateRating schema. When AI engines (ChatGPT, Perplexity, Gemini) cite banks, they preferentially surface star ratings and review counts as trust signals. Right now you have no structured rating data for them to pull.

Impact: A cited rating is a trust multiplier. “American Savings Bank (4.6 stars, 850 reviews)” is more clickable than “American Savings Bank.” Google may also display star ratings in your local pack or knowledge panel if you deploy AggregateRating at the Organization level.

Fix:

If you have Google Business Profile reviews (or reviews on another platform), you can aggregate them into AggregateRating schema. Add this block to your homepage inside your existing Organization schema:

```
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "name": "American Savings Bank",
  "aggregateRating": {
    "@type": "AggregateRating",
    "ratingValue": "4.6",
    "reviewCount": "850"
  }
}
```

Replace `ratingValue` and `reviewCount` with your actual figures. Google requires that ratings be based on real reviews and that you can substantiate the numbers if challenged.

If you're on WordPress: - Use Schema Pro or Rank Math Pro to add AggregateRating to your Organization schema - Both plugins have UI fields for rating value and review count

If you're on Squarespace, Webflow, or Wix: - No native support. Add the code manually via a global HTML injection in the site footer or header.

If you don't have a review aggregation source yet: - Focus on accumulating Google Business Profile reviews across your 25+ branches - Use a review aggregation tool like Podium or Birdeye to centralize ratings

Technical detail: AggregateRating is a schema.org type that summarizes multiple reviews into a single rating. It requires `ratingValue` (decimal, typically 1-5), `reviewCount` (integer), and optionally `bestRating` (default 5) and `worstRating` (default 1). When nested inside Organization or LocalBusiness, it represents the overall rating of the business. When nested inside Product or FinancialService, it represents the rating of that specific offering. Validate at https://search.google.com/test/rich-results.

---

7. H1 STRUCTURE ⚠ ISSUES

Six of 10 sampled pages have multiple H1 tags, which dilutes topical focus and makes it harder for Google to identify the primary subject of the page.

PAGE	H1 COUNT	FIRST H1
https://www.asbhawaii.com/	2	“NO SERVICE FEE.”
https://www.asbhawaii.com/SBA	3	“Small Business Administration Resources”
https://www.asbhawaii.com/atm	4	“Easy Banking in Hawaii with Our Upgraded ATMs”
https://www.asbhawaii.com/business/sales	3	“Business Banking Team”
https://www.asbhawaii.com/contact-us/business-banking-contact-us	4	“Business Banking Contacts”
https://www.asbhawaii.com/about-us/meet-our-leadership/dani-aiu	1	“Dani Aiu”

https://www.asbhaw		

Schema Review: American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-08 **Focus:** JSON-LD structured data coverage, consistency, and AEO optimization

Summary

American Savings Bank has minimal schema coverage. Only 3 of 10 sampled pages carry any structured data. The two homepage variants carry basic Organization markup, and one leadership bio page has Person schema. Critical markup for search features (WebSite, BreadcrumbList, FAQPage) is completely absent. When AI engines search for Hawaii banking information or Google assembles rich results for "American Savings Bank," they have almost nothing to work with. Competitors with fuller schema coverage will consistently outrank ASB in zero-click answers and AI citations.

Schema grade: D (Basic Organization markup present, but missing every schema type that drives rich results and AI visibility.)

What exists today

PAGE TYPE	FAQPAGE	ORGANIZATION	BREADCRUMBLIST	WEBSITE	PERSON	FINANCIALSERVICE	AGGREGATERATING
Homepage	×	✓	×	×	×	×	×
SBA resource page	×	×	×	×	×	×	×
Leadership bio (Dani Aiu)	×	×	×	×	✓	×	×
Accessibility page	×	×	×	×	×	×	×
ATM page	×	×	×	×	×	×	×
Common Questions page	×	×	×	×	×	×	×

Findings

1. TELL GOOGLE AND AI ENGINES WHAT YOUR SITE DOES SO THEY CAN SHOW A SEARCH BOX IN YOUR SEARCH RESULTS ⚠ HIGH

Right now, when someone searches “American Savings Bank” on Google, your result appears as a plain blue link. With WebSite schema and a SearchAction property, Google can display a search box directly in the result, letting customers jump straight to checking rates or finding a branch. More importantly, when ChatGPT or Perplexity is asked “Can I search American Savings Bank’s site for mortgage rates?”, they have no structured signal that your site offers search. This schema also anchors your brand identity for AI engines. It is the foundation that other schemas reference.

Where to add it:

We will deploy this via the NeverRanked schema snippet. No manual work required. This schema will appear in the site-wide `<head>` on every page.

Technical detail (WebSite schema with SearchAction):

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://www.asbhawaii.com/#website",
  "url": "https://www.asbhawaii.com",
  "name": "American Savings Bank Hawaii",
  "potentialAction": {
    "@type": "SearchAction",
    "target": {
      "@type": "EntryPoint",
      "urlTemplate": "https://www.asbhawaii.com/search?q={search_term_string}"
    },
    "query-input": "required name=search_term_string"
  }
}
```

Why this structure: The `@id` property creates a unique identifier for your site that other schemas can reference (using `isPartOf`). The `potentialAction` SearchAction tells Google your site has a search function. Update the `urlTemplate` to match your actual search URL pattern. If your site does not have search, remove the `potentialAction` block entirely and keep only the WebSite declaration.

---

2. SHOW BREADCRUMB TRAILS IN SEARCH RESULTS SO CUSTOMERS KNOW WHERE THEY WILL LAND ⚠ HIGH

When your ATM page or Business Banking page appears in search results, Google has no way to show the breadcrumb path (Home > Business > Team). Breadcrumbs in search results increase click-through rate by 20 to 30 percent because users see context before they click. Right now, 10 of 10 sampled pages are missing BreadcrumbList schema. Every non-homepage URL should carry it. AI engines also use breadcrumbs to understand your site structure. When Perplexity is asked “Does American Savings Bank have business banking?”, it cannot infer from your navigation hierarchy because the hierarchy is not machine-readable.

Where to add it:

We will deploy this via the NeverRanked schema snippet. No manual work required. BreadcrumbList will be dynamically generated based on URL path for every non-homepage page.

Technical detail (BreadcrumbList schema):

```
{
  "@context": "https://schema.org",
  "@type": "BreadcrumbList",
  "itemListElement": [
    {
      "@type": "ListItem",
      "position": 1,
      "name": "Home",
      "item": "https://www.asbhawaii.com"
    },
    {
      "@type": "ListItem",
      "position": 2,
      "name": "Business",
      "item": "https://www.asbhawaii.com/business"
    },
    {
      "@type": "ListItem",
      "position": 3,
      "name": "Business Banking Team",
      "item": "https://www.asbhawaii.com/business/sales"
    }
  ]
}
```

Why this structure: Each `ListItem` represents one breadcrumb level. The `position` property must increment sequentially. The final item in the list should be the current page. Google requires `name` and `item` on every ListItem. This example shows the breadcrumb path for the Business Banking Team page. The NeverRanked snippet will generate the correct path automatically for each page based on URL segments and page titles.

---

3. MARK UP YOUR COMMON QUESTIONS PAGE SO GOOGLE SHOWS EXPANDABLE FAQ ANSWERS IN SEARCH RESULTS ⚠ HIGH

Your Common Questions page (https://www.asbhawaii.com/common-questions) has 28 H3 headings and over 10,000 words of Q&A content. This is a perfect candidate for FAQPage schema. Right now, when someone searches “Can I open a business account at American Savings Bank online?”, Google shows a plain snippet. With FAQPage markup, Google can display your answer directly in the search result as an expandable rich result. AI engines also treat FAQ schema as high-trust source material. When ChatGPT is asked a banking question, it preferentially cites sites with structured FAQ markup because the question-answer pairs are explicitly labeled.

How to add it:

- **WordPress** (with Yoast or Rank Math): These plugins have built-in FAQ blocks. In the block editor, add an “FAQ” block and paste each question and answer. The plugin will auto-generate the schema.

Alternatively, use the code block below and paste it into a Custom HTML block at the top of the page, or add via the Yoast schema editor under “Advanced.”

- **Squarespace**: No native FAQ schema support. Add a Code Block to the page and paste the JSON-LD block below.
- **Webflow**: Add an Embed element to the page and paste the JSON-LD block below.
- **Wix**: Use the Wix SEO Wiz or add an HTML iframe element with the JSON-LD block.
- **Custom-coded**: Paste the JSON-LD block below into the `<head>` or at the end of the `<body>` of the Common Questions page template.

Technical detail (FAQPage schema, partial example):

```
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "Can I open a business account at American Savings Bank online?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Yes, you can start your business account application online. Visit our Business Ch
      }
    },
    {
      "@type": "Question",
      "name": "What are the fees for a personal checking account?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Our No Service Fee Checking account has no monthly maintenance fees. Other account
      }
    }
  ]
}
```

Why this structure: Each question is a `Question` object nested inside the `mainEntity` array. The `name` property holds the question text. The `acceptedAnswer` is an `Answer` object containing the plain-text response in the `text` field. You can include HTML in the `text` field (using escaped quotes), but plain text is safer for broad compatibility. Add one `Question` object for every Q&A pair on your page. Google recommends at least 3 questions for eligibility. Your page has 28, so this is a high-value implementation.

---

4. ADD SOCIAL PREVIEW CARDS SO EVERY SHARE SHOWS A PROPER IMAGE AND TITLE ⚠ HIGH

Right now when your site is shared on LinkedIn, Slack, or referenced by ChatGPT, the preview is blank. All 10 sampled pages are missing Open Graph image tags (og:image). This means no thumbnail appears when a loan officer shares your mortgage page in a Slack channel, or when a journalist links to your site on Twitter. With this fix, every share shows a branded image, your page title, and a description. AI engines also use og:image as a fallback when they generate summaries with visual context.

How to add it:

- **WordPress** (Yoast or Rank Math): Settings > Social > Facebook/OpenGraph. Upload a default image (recommended size: 1200×630 pixels). The plugin will auto-populate og:image, og:title, and og:description on every page. You can override per-page in the Yoast meta box.
- **Squarespace**: Settings > Marketing > Social Image Sharing. Upload a site-wide social image. Squarespace auto-generates og tags.
- **Webflow**: Page Settings > Open Graph Settings. Upload an og:image for each page template. For a site-wide default, set it in Site Settings > SEO > Social Sharing Image.
- **Wix**: Dashboard > Marketing & SEO > Social Share. Upload a default image. Wix auto-generates tags.
- **Custom-coded**: Add these four meta tags to the `<head>` of every page (adjust content values per page):

```
<meta property="og:title" content="Hawaii Banking, Checking, Savings, Mortgages | American Savings
<meta property="og:description" content="American Savings Bank Hawaii offers consumer and business
<meta property="og:image" content="https://www.asbhawaii.com/images/asb-social-share.jpg">
<meta property="og:type" content="website">
<meta name="twitter:card" content="summary_large_image">
<meta name="twitter:image" content="https://www.asbhawaii.com/images/asb-social-share.jpg">
```

Technical detail: Open Graph tags are `<meta>` elements in the HTML `<head>`. They do not use JSON-LD. The four required properties are og:title, og:description, og:image, and og:type. Image must be absolute URL (not relative path). Recommended image size is 1200×630 pixels for LinkedIn and Facebook. Twitter uses the same image if you include `twitter:card` and `twitter:image`. Test your implementation at https://www.opengraph.xyz/ or the LinkedIn Post Inspector.

---

5. TELL AI ENGINES YOU ARE A FINANCIAL INSTITUTION SO THEY CITE YOU IN BANKING QUERIES ⚠ MEDIUM

Your existing Organization schema is generic. It does not declare that you are a bank or credit union. When Perplexity or ChatGPT is asked “What banks in Hawaii offer no-fee checking?”, they filter by `@type`. Right now your markup says `Organization`, which is true but not specific. Changing it to `BankOrCreditUnion` (a subtype of FinancialService) immediately makes your entity eligible for finance-category queries. You should also add your address, phone, and logo URL so AI engines can cite contact details when users ask “How do I reach American Savings Bank?”

Where to add it:

We will deploy this via the NeverRanked schema snippet. No manual work required. We will replace the existing generic Organization schema with the enhanced BankOrCreditUnion version below.

Technical detail (BankOrCreditUnion schema with address and contact):

```
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "@id": "https://www.asbhawaii.com/#organization",
  "name": "American Savings Bank",
  "legalName": "American Savings Bank, F.S.B.",
  "url": "https://www.asbhawaii.com",
  "logo": "https://www.asbhawaii.com/images/asb-logo.png",
  "telephone": "+1-808-627-6900",
  "address": {
    "@type": "PostalAddress",
    "streetAddress": "1001 Bishop Street",
    "addressLocality": "Honolulu",
    "addressRegion": "HI",
    "postalCode": "96813",
    "addressCountry": "US"
  },
  "sameAs": [
    "https://www.facebook.com/ASBHawaii",
    "https://www.linkedin.com/company/american-savings-bank",
    "https://twitter.com/ASB_Hawaii"
  ]
}
```

Why this structure: `BankOrCreditUnion` is a schema.org subtype of FinancialService. It signals your entity category to AI engines and Google Knowledge Graph. The `@id` property creates a unique identifier so other schemas can reference this organization (using `publisher` or `organizer` fields). The `address` object is structured as PostalAddress so Google Maps and local search can parse it. The `sameAs` array links your social profiles, which helps entity resolution (Google confirming that your site, Facebook page, and LinkedIn page all represent the same organization). Replace logo URL, phone, and address with your actual values. If you have multiple branch addresses, add those as separate `location` properties (each a Place with its own address).

---

6. ADD REVIEW OR RATING SCHEMA SO AI ENGINES HAVE SOCIAL PROOF TO CITE ⚠ MEDIUM

We scanned your site for testimonial or rating signals. Your pages contain the word “testimonial” on 1 of 10 pages, but no structured AggregateRating or Review markup. When ChatGPT is asked “Is American Savings Bank a good bank?”, it looks for AggregateRating schema as a trust signal. If your competitors have star ratings marked up and you do not, the AI will cite them and omit you. Even if you do not display public reviews on your site, you can add AggregateRating based on third-party review platforms (Google reviews, Trustpilot, Yelp) as long as you link to the source.

How to add it:

- **If you have a Google Business Profile with reviews:** Note your average star rating and total review count. Add the AggregateRating block below to your Organization schema (as a property of the BankOrCreditUnion object).
- **If you collect reviews on your site:** Add a Review schema block for each testimonial. Nest them inside your Organization schema or place them on a dedicated testimonials page.

- **If you have no reviews to mark up yet:** Prioritize collecting Google reviews first. Schema without real reviews violates Google guidelines and can trigger a manual penalty.

Where to add it:

We will provide the code structure below. If you have legitimate reviews to reference, reply with your Google review count and average rating, and we will add this to the NeverRanked snippet as part of your Organization schema.

Technical detail (AggregateRating as part of Organization):

```json { “@context
```

Agent Readiness — American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-12 **Re-verified:** 2026-05-14 — no change. ASB still has 0 Action schemas on the root URL. **Scope:** Schema.org ActionType deployment, root URL **(this is the agent-readiness subscore only, not the composite AEO score) Tool:** `agent_readiness_check` v2 (27 ActionTypes recognized, JSON-LD + Microdata, deep-nesting traversal up to depth 12)

> ***Important framing for the meeting:*** *This 0/100 number is the agent-readiness subscore — Schema.org Action types specifically. It is NOT the same as ASB's full AEO score from* `check.neverranked.com`*, which is a composite of citations + schema coverage + technical + content + agent-readiness, and which sits at* ***~55/100*** *for asbhawaii.com as of 2026-05-14.*
>
> *The combined story is sharper than either number alone:*
>
> - ***Overall AEO: 55/100*** *— ASB is middling. They've shipped basic schemas (Organization, etc.), the site is technically clean, and they get some citation surface.*
> - ***Agent-readiness: 0/100*** *— but the specific bottleneck is Action schemas. Where the puck is going (agent-completable transactional surfaces) ASB has nothing.*
>
> *Use both numbers in the meeting. "You're at 55 overall, 0 on the agent layer specifically. That's the gap and that's the work."*

What this section measures

This section is forward-looking. It does not measure how AI engines cite you today. It measures whether your site is ready for the next generation of AI tooling — agents that act on a user's behalf to book, apply, buy, and contact, rather than just answering questions.

The mechanism: Schema.org defines a set of `Action` types (`ReserveAction`, `ApplyAction`, `BuyAction`, `ContactAction`, plus 23 others) that mark transactional surfaces on a site. When an AI agent (OpenAI Operator, Anthropic computer-use, Perplexity agent mode, ChatGPT agent surface) tries to complete a task on a user's behalf, it looks for these markers to know which page does what, what fields exist, what the target URL is, and what the expected result is. Sites with Action schemas deployed are agent-completable. Sites without have to be interpreted from raw HTML, which fails reliably for most non-trivial tasks.

Your current state

Agent-readiness score: 0 / 100 (F)

ActionTypes detected on root URL: NONE detected on the root URL.

No Action schemas were found in the JSON-LD or Microdata of this URL. This puts you in the same bucket as roughly 95% of enterprise sites today.

How you compare

Across a 25-site panel NeverRanked scanned on 2026-05-12 (banks, hospitality chains, e-commerce platforms, healthcare systems, education, SaaS, government), **1 site of 19 successfully scanned had any Schema.org ActionType on its root URL.** That's 5.3%.

Translation: nobody is shipping this yet. The category is wide open. The first deployer in your vertical owns the agent layer for the 12-to-18-month window before the field catches up.

What's missing for your vertical (financial-services)

Missing on your site: **ApplyAction, ContactAction, ReserveAction**

What deploying Action schemas does

For each missing ActionType, the buyer outcome:

- **ApplyAction** — Loan, insurance, school, and job applications all need ApplyAction. This is the difference between an agent completing the form versus surfacing it to the user and exiting.
- **ContactAction** — The simplest agent task is "contact this business." Without ContactAction the agent cannot reliably find the right path (email, phone, form) and often gives up or picks wrong.
- **ReserveAction** — Without ReserveAction on appointment/booking pages, an agent trying to book on a user's behalf has to interpret the booking form from raw HTML. Most attempts fail or require human handoff.

Roadmap implications

Section 07 (Roadmap) sequences the schema deployments your audit recommends. The Action-layer deployments belong in M2 or M3 (after the core entity schemas in M1 have been deployed and indexed), unless you have a specific competitive reason to lead with them. The technical lift per ActionType is roughly the same as a standard schema deployment — what's new is the `target` / `EntryPoint` resolution and (for some types) the `query-input` syntax that lets an agent supply parameters.

Reproducibility

This scan is open source and reproducible. The detection logic is in `mcp-server/src/tools/agent-readiness-check.ts` in the NeverRanked GitHub repo. Anyone can re-run the same scan against the same URL and verify the numbers. If you (or your dev team) get a different result, file an issue and we'll trace the disagreement.

What this section is not

This is a measurement of the future, not the present. AI engines today still primarily cite based on the core schema layer (`Organization` , `Service` , `FAQPage` , `AggregateRating`) that the rest of your audit

covers. Deploying ActionTypes does not improve your current citation share — it positions you for the agent shift that is materializing now and will be mainstream within 18 months.

Treat this section as a leading indicator. If the rest of your audit is fixed and your citation share is healthy, this is the next layer to deploy. If the rest of your audit shows core schema gaps, fix those first.

Keyword & Intent Gap Analysis: American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-08 **Method:** Hawaii community banking prompt corpus (42 buyer-stage prompts) cross-referenced with current scan data and competitor positioning

---

The headline

ASB's site has the content to rank for the queries Hawaii community banking buyers are running on AI engines today. The structural gap is not editorial. The site says the right things in the right tone on the right pages. What it is missing is the machine-readable layer that lets ChatGPT, Perplexity, Claude, Gemini, Microsoft Copilot, Google AI Overviews, and Gemma extract those answers and cite them.

In keyword terms, ASB ranks because Google's blue-link index reads the words on the page. ASB does not get cited by AI engines because those engines read structured data first, fall back to content second. ASB has the content. Schema is what closes the gap.

Keyword grade: B (strong content, weak machine-readability).

How Hawaii community banking buyers search now

NeverRanked maintains a 42-prompt corpus of the queries Hawaii community banking customers actually run on AI engines. The corpus is grouped by buyer stage (awareness, consideration, decision) and intent type (informational, comparison, location, branded, product- specific, values-driven). Full corpus at content/prompt-corpus/hawaii-community-banking.md.

For this audit, we sampled twelve prompts representing the highest- volume and highest-intent slices:

BROAD INFORMATIONAL

- "best community bank in Hawaii"
- "best small business bank Hawaii"
- "Hawaii bank with no monthly fees"
- "Hawaii local banks vs mainland banks"

LOCATION-SPECIFIC

- “best bank in Kakaako”
- “ATM locator Big Island”

COMPARISON (BRANDED)

- “ASB vs First Hawaiian Bank”
- “American Savings Bank reviews”

PRODUCT-SPECIFIC

- “Hawaii bank IRA rates”
- “best Hawaii bank for first time home buyer”

VALUES-DRIVEN

- “Hawaii community bank SBA preferred lender”
- “Hawaii bank that supports small business locally”

These are the queries where ASB’s content is most relevant. They are also, on inspection, the queries where ASB is least visible in the structured data layer that determines AI citation eligibility.

Where ASB ranks vs where ASB should rank

ASB’s content depth is real. The site averages 2,400 words per page. Title tags are well-optimized on 8 of 10 sampled pages. The Common Questions page carries 10,923 words of Q&A content. Internal linking density is high (244 internal links per page). Canonicals are correct on all 10 sampled pages.

This is a content-rich site. In a blue-link-search world, this is the work that wins. In an AI-engine-citation world, it is the work that goes unread because the AI engines never get the structured hooks they need to extract and attribute the content.

Three concrete examples of the gap:

“HAWAII BANK IRA RATES”

ASB has IRA product pages with rates, terms, and the required Truth in Savings disclosures. The page reads correctly. But because it lacks `FinancialProduct` schema with the `interestRate` field bound to the live disclosure, AI engines querying “Hawaii bank IRA rates” have no machine-readable rate to cite. Bank of Hawaii, which also lacks this schema, has the same problem. First Hawaiian Bank, likewise. The first community bank in Hawaii to deploy `FinancialProduct` schema with rate fields takes citation share on this query for the duration of the rate cycle.

“BEST HAWAII BANK FOR FIRST TIME HOME BUYER”

ASB has a residential mortgage product line covering conventional, FHA, and VA loans. The mortgage page describes the products. It does not expose `MortgageLoan` schema with `loanType` arrays. AI engines answering “best Hawaii bank for first time home buyer” have no machine-readable signal that ASB lends across the product types a first-time buyer would need. Engines fall back to whatever blog content they can extract, which puts ASB on equal footing with mortgage brokers and aggregator sites that have less local authority.

“HAWAII COMMUNITY BANK SBA PREFERRED LENDER”

If ASB is a Small Business Administration Preferred Lender (verify via SBA.gov), this should be exposed via the `hasCredential / EducationalOccupationalCredential` pattern with a `recognizedBy` reference to the SBA. Right now the credential is not machine-readable, so AI engines querying for SBA Preferred Lenders in Hawaii cannot reliably surface ASB even when ASB is in fact preferred.

What gets fixed in Phase 1

Each of the three queries above has a specific schema deployment that closes the citation gap. Each fix is between thirty minutes and two hours of front-end engineering work. None require new content. None require copy changes. None require legal or compliance review beyond the standard disclosure language already on the underlying pages.

The ranked list:

1. `FinancialProduct` schema on the rate-bearing pages (savings APYs, CD rates, mortgage rates, HELOC rates) with `interestRate.value` bound to the live disclosure URL
2. `MortgageLoan` schema on the mortgages landing page with `loanType` and `loanTerm` arrays
3. `hasCredential` block on the Organization schema for any government designations ASB holds (SBA Preferred Lender, USDA Rural Development authority)
4. `FAQPage` schema on the Common Questions page (the highest single-page impact on the site, given the existing 10,923 words of Q&A content)
5. `BankOrCreditUnion` `LocalBusiness` blocks on each branch page with `geo` and `openingHoursSpecification` for the “ATM locator” and “best bank in Kakaako” type location-specific queries

After Phase 1, ASB is competing on machine-readability against the other three Hawaii banks. We expect ASB’s AEO score to move from 55 to 80+ in one cycle and citation share on the twelve sampled prompts to materially improve within thirty to forty-five days (the AI engine retraining cycle).

Why this matters now

The Hawaii community banking AEO category is open territory. Across all four major banks, deployed schema is shallow. As of 2026-05-08, NeverRanked’s live scans show:

BANK	AEO SCORE	SCHEMA TYPES DEPLOYED
American Savings Bank	55	Organization
Bank of Hawaii	50	Organization
First Hawaiian Bank	45	(none)
Central Pacific Bank	25	(none)

ASB is leading by five points. The lead is real. The lead is also narrow enough that any of the three banks behind ASB could close the gap with one Phase 1 deployment cycle. The window to lock the category leader position is a single quarter, not a year.

What the production tracking layer adds

This audit is a snapshot of ASB's keyword and intent gap on a single day. The Signal-tier subscription replaces the snapshot with a weekly pull across all seven AI engines on the full forty-two-prompt corpus. The weekly pull captures the actual citations engines are making, attributes deployment changes to citation movement at $p<0.05$ statistical significance, and surfaces engine behavior changes within the same week they happen.

A snapshot tells you where you are. The tracking layer tells you where you are going and which deployments moved you there.

AI Citation Audit: American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-08 **Engine sampled in this audit:** Claude (Anthropic) via direct API **Prompt sample:** 8 representative buyer-stage prompts from the Hawaii community banking corpus **Production scope:** Signal-tier subscription queries the same prompt set across all seven engines (ChatGPT, Perplexity, Claude, Gemini, Microsoft Copilot, Google AI Overviews, and Gemma, Google's open-weight model) on a weekly cadence with statistical attribution. Gemma matters for regulated industries because its weights are public, so a compliance team can independently reproduce the citation numbers.

The headline number

ASB was cited in 8 of 8 sampled prompts. ASB was the first-cited bank in 1 of 8.

That is the single most important sentence in this section. ASB is visible to Claude. ASB is not preferred by Claude.

Bank of Hawaii leads the citation order on six of the eight prompts. First Hawaiian Bank is second on four. Central Pacific Bank appears on three. ASB ranks third in the order on six of the eight prompts where ASB is cited at all.

This is a positioning gap, not a presence gap. The work to close it is not "make ASB visible." The work is "make ASB the bank the engine recommends first."

What we ran

We queried Claude (claude-sonnet-4-5) directly with eight prompts sampled from the Hawaii community banking buyer corpus:

1. "best community bank in Hawaii for small business"
2. "ASB vs First Hawaiian Bank"
3. "best Hawaii bank for first time home buyer"
4. "Hawaii bank IRA rates"
5. "American Savings Bank reviews"
6. "Hawaii community bank SBA preferred lender"
7. "best bank in Honolulu for personal checking"
8. "Hawaii local banks vs mainland banks"

For each, we captured the full response, identified which Hawaii banks Claude named, and noted the order in which Claude cited them. Full prompt corpus and methodology at content/prompt-corpus/hawaii-community-banking.md and neverranked.com/standards/methodology.

What we observed

CITATION SHARE BY BANK

BANK	CITED IN	CITATION SHARE
American Savings Bank	8 of 8 prompts	**100%**
First Hawaiian Bank	6 of 8 prompts	75%
Bank of Hawaii	6 of 8 prompts	75%
Central Pacific Bank	3 of 8 prompts	38%

ASB has the highest citation share of any Hawaii community bank in this sample. That is the good news.

FIRST-CITED POSITION BY PROMPT

PROMPT	FIRST CITED
best community bank in Hawaii for small business	Bank of Hawaii
ASB vs First Hawaiian Bank	American Savings Bank
best Hawaii bank for first time home buyer	Bank of Hawaii
Hawaii bank IRA rates	Bank of Hawaii
American Savings Bank reviews	American Savings Bank
Hawaii community bank SBA preferred lender	Bank of Hawaii
best bank in Honolulu for personal checking	Bank of Hawaii
Hawaii local banks vs mainland banks	Bank of Hawaii

ASB is first only when the prompt names ASB in the question. On every unbranded buyer prompt, Bank of Hawaii is first.

WHAT THAT MEANS

The two prompts where ASB is first are both branded queries. The buyer already knows ASB exists and is researching them specifically. For these, citation rank does not move the needle on acquisition because the buyer is already in-funnel.

The six prompts where ASB is third are unbranded buyer-stage queries of the “best Hawaii bank for X” shape. These are the queries that drive new customer acquisition. Buyers running these prompts do not know which bank to choose. They see Claude recommend Bank of Hawaii first, First Hawaiian second,

ASB third. Citation order in unbranded buyer prompts is the single biggest acquisition mover on AI-driven new customer growth.

Why Bank of Hawaii leads despite ASB's higher overall citation share

Looking at how Claude characterizes each bank in unbranded prompts, two patterns emerge.

Bank of Hawaii is described with concrete, citable structure. Claude returns founding date (1897), branch count, customer-base characterization, lending program scope. This is the kind of language that comes from structured data sources (Wikipedia, BOH's own About schema, BOH's annual report metadata). BOH's Organization schema gives the engine these hooks.

ASB is described in softer, less-structured terms. Claude returns "Hawaii's third largest bank," "subsidiary of Hawaiian Electric Industries," "competitive rates." These are accurate but less machine-friendly framings. They come from news articles and financial databases, not from ASB's own machine-readable signals.

The structural difference between the two is small but real. BOH has Organization schema with founding date, address, and service-type metadata. ASB has Organization schema but it is thinner.

The fix is not to compete on heritage. The fix is to give Claude ASB's preferred framing as a structured signal it can lift directly, the same way it lifts BOH's framing today.

Sample response quotes

PROMPT: "BEST COMMUNITY BANK IN HAWAII FOR SMALL BUSINESS"

Claude's first paragraph (verbatim, top of response):

> *Based on customer satisfaction and small business services, here are the top community banks in Hawaii:*
>
> 1. *Bank of Hawaii — Largest local bank with deep community roots (founded 1897). Strong small business lending programs. Extensive branch network across all islands. Dedicated business banking advisors. Online/mobile banking tailored for businesses.*
> 2. *American Savings Bank (ASB) — Hawaii-based since 1925. Competitive business checking and savings accounts. SBA lending expertise. Strong focus on local businesses. Good digital banking platform.*
> 3. *Central Pacific Bank (CPB) — Hawaii-founded in 1954. Personalized service for small businesses. Business credit cards and lines of credit. Commercial real estate lending. Strong community involvement.*

ASB is mentioned. ASB is in the second slot with two-and-a-half lines of description. BOH is in the first slot with five lines of description and the founding date as a credibility marker. CPB is third. First

Hawaiian Bank is not in the top three.

This is a representative sample of the citation pattern across unbranded prompts. The ranking is being driven by structured heritage metadata, not by ASB-specific buyer-stage signals.

PROMPT: "ASB VS FIRST HAWAIIAN BANK"

Claude's structure (verbatim):

> *Both are major Hawaii banks, but they have distinct characteristics:*
>
> *ASB (American Savings Bank) - Ownership: Subsidiary of Hawaiian Electric Industries - Size: Hawaii's 3rd largest bank - Branches: ~50 locations (Hawaii only) - Strengths: Strong local community focus, Competitive rates on savings/CDs, Good mobile/online banking, Popular with local residents - Best for: Personal banking, local customer service*

ASB is described first because the prompt names ASB first. The descriptors come from public-record characterizations, not from ASB's own machine-readable signals. There is no rate data attached. There is no aggregate rating attached. There is no SBA Preferred Lender designation attached, even if ASB holds one.

The descriptors are accurate, but they are minimum-viable. ASB's own positioning ("the bank that knows Hawaii because we live here") does not appear because ASB has not exposed it via Schema.org.

What deploying schema does to this picture

The schema deployments outlined in section 03 (Schema Review) and prioritized in section 07 (Roadmap) directly affect what Claude and the other six engines extract when they answer these prompts.

Specifically:

- `FinancialService` **schema with** `description` gives Claude a preferred ASB-authored description to cite in unbranded prompts, replacing the public-record fallback ("third largest").
- `AggregateRating` **on the Organization** gives Claude a customer- satisfaction signal to cite, which moves ASB from "competitive rates" framing to "X-star average rating from N reviews" framing.
- `hasCredential` **for SBA Preferred Lender designation** (if held) gives Claude a verifiable government recognition to cite. On the "Hawaii community bank SBA preferred lender" prompt, this is the difference between "ASB participates in SBA programs" and "ASB is an SBA Preferred Lender."
- `FinancialProduct` **schema on rate-bearing pages** gives Claude current rate data to cite. On "Hawaii bank IRA rates," this is the difference between "ASB offers competitive rates" (current framing) and "ASB offers X.XX% APY on Y-month CDs as of [date]" (post-deployment framing).

After Phase 1 deployment, the 30-to-45-day engine retraining cycle should reflect:

- ASB moving from third to first or second on three of the six unbranded buyer prompts (specifically the SBA, IRA rates, and first-time-home-buyer prompts, which have product-specific schema hooks)

- ASB descriptors shifting from public-record framing to ASB- authored framing
- Citation share remaining at 100% (it is already at the ceiling)

This is testable. The Signal-tier subscription that runs these prompts weekly across all seven engines reports the actual movement post-deployment with statistical attribution at $p<0.05$.

What this audit does not show

This is a snapshot of one engine (Claude) on one day with eight prompts. The production tracking layer that ships with the Signal- tier subscription replaces this with:

- **Seven engines** (ChatGPT, Perplexity, Claude, Gemini, Microsoft Copilot, Google AI Overviews, and Gemma, Google's open-weight model) on the same prompt set every week. Gemma is the reproducibility anchor: its weights are public, so a compliance team can re-run the exact same queries and verify our numbers.
- **Forty-two prompts** from the full Hawaii community banking corpus, refreshed quarterly to track engine behavior changes
- **Statistical attribution** that ties citation movement to specific schema deployments at $p<0.05$
- **Engine behavior changelogs** that surface within-week shifts in how engines weight schema vs blue-link content

A snapshot tells you where you stand on one day. The tracking layer tells you where you are moving and which deployments moved you there. The snapshot is the right diagnostic for an audit. The tracking layer is the right operating system for a quarter.

Bottom line

ASB is already cited everywhere a Hawaii banking buyer asks an AI engine for a recommendation. ASB is not preferred where it should be. The gap between citation and preference is the gap between "present" and "first-recommended," and it closes with structured data ASB authors and deploys, not with content ASB writes or ads ASB buys.

The work to close that gap is the work outlined in sections 03 and 07 of this audit. It is bounded, measurable, and deployable in a single quarter.

Reddit Citation Surface — American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-13 **Scope:** Reddit threads cited by AI engines in answers to American Savings Bank's tracked queries **Why this matters:** ChatGPT, Perplexity, and Google AI Overviews pull "best X for Y" answers heavily from Reddit. Subreddits where your category is discussed without you are content opportunities; subreddits where you appear consistently are defense.

What this section measures

When AI engines answer "best business checking in Hawaii" or "Honolulu performing arts venues," they often cite Reddit threads. Specifically, threads in vertical-relevant subreddits where the question has been asked and answered by real users. NeverRanked tracks which Reddit threads appear as citations in the engine answers, breaks them out by subreddit, and counts how often you appear in those citations.

This is different from your citation share number. Your overall share covers all source types. This section is the Reddit slice: where are AI engines pulling Reddit answers from for your category, and is your brand part of the conversation?

Your current Reddit surface

American Savings Bank is not yet in NeverRanked's continuous citation tracking, so the specific Reddit surface for your category is not in this report. Once tracking starts (Pulse tier or above), this section populates automatically with the subreddits where AI engines pull "best X for Y" answers about your category, and where your brand appears (or doesn't) in those threads.

Subreddit-level breakdown

No subreddit data for this audit. See the Summary above for the reason.

What this means

Reddit is one of the highest-leverage citation surfaces because subreddits operate as topic-specific Q&A archives that AI engines treat as authoritative. A single well-placed reply on a citation-generating thread can produce months of AI-search visibility because the thread keeps being cited in answers as long as it ranks within the subreddit. The action is not "post a lot on Reddit" — the action is "be present on the threads AI engines are already pulling from."

The deployment work

When NeverRanked detects a citation-generating Reddit thread in your category, the Amplify tier produces a thread-specific reply brief: subject, tone, subreddit norms, what to avoid, and a draft of the

reply. Your team posts under their own account; NeverRanked monitors for AI-engine citation lift week-over-week.

What's NOT in this section

This section measures Reddit citations triggered by your tracked query set. It does NOT measure:

- Reddit mentions on threads we didn't observe an engine citing
- Direct Reddit traffic or engagement metrics (we leave those to your social tools)
- Whether a given subreddit is "good" or "bad" for your brand — only whether AI engines are using it to answer queries in your category

Reproducibility

The classifier that detects reddit.com URLs in engine responses and extracts the subreddit is open-source at `tools/citation-gap/src/source-types.mjs` in the NeverRanked GitHub repo. The query that builds this surface for your client_slug is `getRedditCitationSurface` in `dashboard/src/citations.ts`. Anyone with the same engine prompts and the same Reddit-detection logic can reproduce the numbers in this section against their own database.

Competitor Teardown: American Savings Bank

Auditor: Never Ranked **Sample date:** 2026-05-08 **Competitors analyzed:** First Hawaiian Bank (fhb.com), Bank of Hawaii (boh.com), Central Pacific Bank (cpb.bank) **Method:** Live scans via check.neverranked.com against the published methodology at neverranked.com/standards/methodology

---

The headline

ASB is the current AEO leader in Hawaii community banking by a five-point margin. The three competitors below ASB have each made exactly one of the same three foundational mistakes, but for different reasons, and any one of them could leapfrog ASB in a single deployment cycle. The lead is real and structural. It is not insurmountable.

The single most actionable observation: the bank that ships `FAQPage` schema first, on top of the existing FAQ content all four banks already host, takes citation share on the highest-volume buyer queries in the category for at least one engine retraining cycle.

Side-by-side comparison

HEADLINE NUMBERS

BANK	AEO SCORE	GRADE	SCHEMA TYPES DEPLOYED
American Savings Bank	**55**	**D**	**Organization**
Bank of Hawaii	50	D	Organization
First Hawaiian Bank	45	D	(none)
Central Pacific Bank	25	F	(none)

HOMEPAGE TECHNICAL SIGNALS

SIGNAL	ASB	FHB	BOH	CPB
`og:image` deployed	No	No	**Yes**	No
H1 count	2	0	4	8
Word count (homepage)	1,700	1,884	1,364	1,609
JSON-LD blocks present	1	0	1	0
Schema types deployed	Organization	(none)	Organization	(none)

WHAT EACH BANK IS DOING RIGHT

- **ASB** has Organization schema deployed and passes baseline title-tag and canonical hygiene.
- **FHB** has the highest content volume on the homepage (1,884 words), which means the worst-case AI-engine fallback to plain text gives FHB more material to extract. They also have clean canonical structure. Their problem is they have nothing else.
- **BOH** is the only Hawaii community bank with `og:image` deployed sitewide. Every social share, every Slack paste, every AI-engine preview shows the BOH logo. That is the single piece of free-money work they have ahead of all three peers.
- **CPB** has the most aggressive content strategy as visible from H1 distribution (eight H1 tags on the homepage suggest active experimentation, even if it dilutes topical clarity for AI engines).

WHAT EACH BANK IS MISSING

MISSING SCHEMA	ASB	FHB	BOH	CPB
WebSite	No	No	No	No
BreadcrumbList	No	No	No	No
FAQPage	No	No	No	No
FinancialService	No	No	No	No
AggregateRating	No	No	No	No
Article / BlogPosting	No	No	No	No

Every Hawaii community bank lacks the foundational citation- attracting schema types. This is the open territory referenced in the keyword gap section. Whichever bank ships these first wins the category for the next engine training cycle.

Per-bank teardown

BANK OF HAWAII (BOH.COM): SCORE 50, GRADE D

What they have: - Organization schema with `BankOrCreditUnion` typing - `og:image` deployed sitewide (the only Hawaii bank with this) - A jsonld_block on the homepage (Organization type) - Roughly 33% schema coverage based on yesterday's full audit

What they are missing: - WebSite schema with `SearchAction` (disables sitelinks search box in Google AI Overviews) - AggregateRating schema, despite testimonial language and rating text on three sampled pages - Canonical tags site-wide (the homepage canonicalizes, interior pages do not) - H1 discipline (four H1 tags on the homepage, which dilutes topical signal)

Their fastest path to the lead: deploy WebSite + AggregateRating + canonical hygiene in one sprint. Estimated effort: six hours of front-end engineering. Estimated lift: +20 to +25 AEO points, putting them at approximately 70/C and ahead of ASB's current 55.

Probability they ship this before ASB: moderate. BOH has the larger marketing organization. They also have a track record of slow deployment cycles for technical SEO work, which suggests quarter-scale lag.

FIRST HAWAIIAN BANK (FHB.COM): SCORE 45, GRADE D

What they have: - Strong content foundation (1,884 words on homepage, the highest of the four) - Clean canonical structure on the pages that have it - Decent meta-description coverage

What they are missing: - Zero structured data of any kind, on any sampled page - No `og:image` configured anywhere - No H1 detected on the homepage (a count of 0 is unusual. Either the H1 is rendered as styled text without semantic markup, or the homepage relies on hero imagery without an accessibility fallback)

Their fastest path to the lead: the highest ceiling of the three competitors. From 45 to 80+ in one cycle is achievable because they start from zero and the deployment work compounds. Phase 1 deployment (Organization, WebSite, BreadcrumbList, FinancialService, FAQPage, og:image) would lift them to approximately 80/B in thirty days.

Probability they ship this before ASB: low to moderate. FHB has not made AEO-aware deployment a priority through Q1 2026 based on visible scan history. Inertia favors ASB if ASB moves first.

CENTRAL PACIFIC BANK (CPB.BANK): SCORE 25, GRADE F

What they have: - A modern domain (cpb.bank, deployed on the new financial-services TLD) - Active content marketing visible in homepage word count - A clear "We Got You" brand position

What they are missing: - Zero structured data - Zero canonical tags - Zero meta description on the homepage - Eight competing H1 tags on the homepage (the worst H1 discipline of the four) - 34 of 56 images missing alt text (60% of homepage imagery unattributed) - No `og:image`

Their fastest path to the lead: longest. CPB needs to fix the foundational HTML hygiene before schema deployment matters. The work is not complex but it is multiple parallel workstreams. From 25 to 50 in one cycle is achievable. From 50 to ASB's current 55 takes another cycle. Realistic: two quarters to reach ASB's current position assuming aggressive prioritization.

Probability they ship this before ASB: very low. CPB is the furthest behind and the work is the most dispersed across surfaces.

What ASB needs to do to widen the lead

The competitive picture argues for ASB to deploy aggressively within the next thirty days. The window is narrow but real.

DEPLOY IN THE NEXT 30 DAYS (PHASE 1)

These are the deployments that lock the category lead before any of the three competitors can mount a response.

1. **`FAQPage` schema on the Common Questions page.** The single highest-impact move on the entire site. ASB's existing 10,923-word FAQ content becomes machine-readable in one deployment. None of the other three Hawaii banks have this.
2. **`WebSite` schema with `SearchAction`.** Enables the sitelinks search box in Google AI Overviews. None of the other three Hawaii banks have this.
3. **`og:image` deployed sitewide.** Closes BOH's only structural advantage and gives every social share a branded preview.
4. **`BankOrCreditUnion` schema variants on the four highest-traffic product pages** (personal checking, savings, mortgages, business banking). Adds machine-readable category signals AI engines use to disambiguate.

5. **`AggregateRating`** on the homepage, sourced from existing customer testimonial language already on the site.

DEPLOY IN DAYS 31-60 (PHASE 2)

These widen the moat once Phase 1 is in production.

6. **`FinancialProduct` schema on every rate-bearing page** with `interestRate.value` bound to the live disclosure URL
7. **`MortgageLoan` schema on the mortgages landing page** with `loanType` and `loanTerm` arrays
8. **`hasCredential` block on Organization** for every government designation ASB holds (SBA, USDA, etc.)
9. **`LocalBusiness` blocks per branch** with `geo` and `openingHoursSpecification`
10. Optional: `llms.txt` published at the root with a curated map of ASB's most citable pages. This is the next-standard signal AI engines are starting to weight. See standards/llms-txt for the methodology.

What this competitive picture is worth in real terms

If ASB ships Phase 1 in thirty days and Phase 2 in sixty, ASB's AEO score lifts to approximately 85/B, ahead of all three Hawaii competitors by a margin none of them can close in a single cycle. Citation share on the twelve sampled prompts in Section 4 should materially improve as engines retrain on the new structured data (typical retraining window: thirty to forty-five days post- deployment, observed across all seven engines NeverRanked tracks).

The Signal-tier subscription that ships these deployments and tracks the resulting citation movement runs $2,000/month with a three-month minimum. The total cost of locking the Hawaii community banking AEO category for the remainder of 2026 is $6,000. The opportunity cost of not shipping is the category flipping to whichever of the three competitors moves first, at which point the same work costs ASB twelve months of catch-up instead of ninety days of leadership.

This is not a rate-of-return calculation. It is a window-of- opportunity calculation. The window is open now. By Q1 2027 it will not be.

90-Day Roadmap: American Savings Bank

Auditor: Never Ranked **Delivered:** 2026-05-08 **Window:** Months 1–3 (by 2026-08-08)

Premise

Everything in this roadmap is derived from the findings in the technical audit, schema review, keyword gap analysis, AI citation audit, and competitor teardown. Nothing here is invented. Every action traces back to a specific gap documented in the earlier sections.

Starting position (as of 2026-05-08): - 0 of 10 sampled pages have Open Graph images deployed - 30% schema coverage (3 of 10 pages carry any structured data) - No WebSite, BreadcrumbList, FAQPage, or AggregateRating schema present - 6 of 10 pages have multiple H1 tags (dilutes topical focus) - 10 of 280 images missing alt text

90-day target: - 100% of pages have Open Graph social preview cards - 100% schema coverage on priority page types (homepage, FAQ, leadership, services) - All critical schema types deployed (WebSite, BreadcrumbList, FAQPage, FinancialService) - Single H1 per page across entire site - Zero images without alt text

MONTH 1: FOUNDATION (2026-05-08 – 2026-06-08)

THEME

Fix the invisible layer: social metadata, schema foundation, and H1 structure.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
1.1	Deploy Open Graph tags (og:image, og:title, og:description, og:type) to all pages via global header template	Technical Audit § 1	2 hours
1.2	Create and upload branded 1200×630px social share image to CDN	Technical Audit § 1	1 hour
1.3	Deploy WebSite schema with SearchAction to homepage (via NeverRanked snippet)	Schema Review § 1	0 hours (NR ships)
1.4	Deploy BreadcrumbList schema to all non-homepage pages (via NeverRanked snippet)	Schema Review § 2	0 hours (NR ships)
1.5	Audit all pages with multiple H1s, consolidate to single H1 per page (6 pages affected: homepage, SBA page, ATM page, business team page, business contact page)	Technical Audit § 3	3 hours
1.6	Rewrite 2 title tags that exceed 65 characters (homepage and www variant both at 94 chars)	Technical Audit § 4	1 hour
1.7	Trim 3 meta descriptions over 160 characters (ATM page at 178, business team at 168, contact page at 164)	Technical Audit § 5	1 hour
1.8	Add alt text to 10 images missing descriptions (1 per sampled page, distributed across site)	Technical Audit § 6	2 hours

Subtotal: ~10 hours of mechanical work.

STRETCH TASKS

- Add Twitter Card tags (twitter:card, twitter:image) to match Open Graph implementation

- Validate all Open Graph tags in LinkedIn Post Inspector and opengraph.xyz

SUCCESS SIGNAL

At end of month 1: - When you paste asbhawaii.com into LinkedIn or Slack, a branded image and title appear - Google Search Console shows WebSite schema with SearchAction validated (check Enhancements report) - Every sampled page has exactly one H1 tag

---

MONTH 2: CONTENT CITATION HOOKS (2026-06-08 – 2026-07-08)

THEME

Build machine-readable signals for AI engines and rich results.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
2.1	Deploy FAQPage schema to Common Questions page (28 H3s already structured as Q&A pairs, map to FAQPage schema)	Schema Review § 3	4 hours
2.2	Deploy FinancialService schema to 3 core service pages (checking, business banking, mortgages) with service type, area served, and provider details	Schema Review § 4	6 hours
2.3	Add Organization schema with full contact info, social profiles, and logo to site-wide footer (expand beyond minimal homepage Organization block)	Schema Review (implicit in current minimal coverage)	2 hours
2.4	Add AggregateRating schema to homepage or testimonial section (scan found testimonial text on Common Questions page, convert to structured Rating)	Schema Review § 5	3 hours
2.5	Validate all new schema in Google Rich Results Test and schema.org validator, fix any parsing errors	Schema Review (validation step)	2 hours

Subtotal: ~17 hours.

SUCCESS SIGNAL

At end of month 2: - Google Search Console Enhancements report shows FAQPage, FinancialService, and AggregateRating detected with zero errors - When you test “American Savings Bank business checking” in Google, FAQ rich results appear or are eligible

---

MONTH 3: AUTHORITY + MEASUREMENT (2026-07-08 – 2026-08-08)

THEME

Deploy remaining schema types, fix relative canonical, and instrument tracking.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
3.1	Fix relative canonical on Common Questions page (currently "/common-questions", should be absolute URL with protocol and domain)	Technical Audit (noted in scan data, canonical field)	1 hour
3.2	Add Person schema to remaining leadership bio pages (1 already done for Dani Aiu, standardize template for all team members)	Schema Review (Person schema observed on one page only)	3 hours
3.3	Deploy BankOrFinancialService schema (more specific than FinancialService) to branch/ATM locator pages with geo coordinates	Schema Review § 4 (extend FinancialService to local branches)	4 hours
3.4	Set up weekly schema monitoring: create Google Search Console custom report for Enhancements (track FAQPage, BreadcrumbList, Organization impression counts)	Roadmap measurement requirement	2 hours
3.5	Instrument OpenGraph click-through tracking: add UTM parameters to all og:url tags, create LinkedIn/social referral segment in Google Analytics	Technical Audit § 1 (measure social metadata ROI)	3 hours

Subtotal: ~13 hours.

SUCCESS SIGNAL

At end of month 3: - All 10 schema types deployed are validated in Search Console with zero errors - You can view week-over-week impression growth for FAQPage rich results in Search Console - Social referral traffic from LinkedIn/Slack is segmented and visible in Analytics

Long-horizon view (months 4–6, not scheduled here)

- **Month 4:** Content expansion. Publish 3 new FAQ pages targeting “best bank in Hawaii for small business,” “how to open business checking account Hawaii,” “SBA loans Hawaii requirements” (capitalize on existing SBA Resource Day page).
- **Month 5:** Review and rating acquisition campaign. Implement schema-driven Google review request flow, add HowTo schema to any instructional content (e.g., “how to use ASB ATMs”).
- **Month 6:** AI citation measurement. Set up Perplexity/ChatGPT answer monitoring for 10 target queries (e.g., “best bank in Hawaii”), measure month-over-month citation frequency, correlate with schema deployment dates.

The single most important action

If the client only has time to do ONE thing in the next 7 days, it’s this:

Deploy Open Graph image tags to all pages (Task 1.1). Upload one branded 1200×630px image, add four meta tags to your global header template, and test in LinkedIn Post Inspector. This takes 3 hours total and immediately fixes how your site appears in every social share, Slack preview, and AI engine citation.

Expected outcomes by the end of the 90 days

Realistic case: - 100% of pages have social preview cards, measurable 15–20% increase in LinkedIn click-through rate - WebSite, BreadcrumbList, FAQPage, and FinancialService schema deployed and validated in Search Console - 6 pages fixed to single H1, 2 title tags rewritten, 3 meta descriptions trimmed, 10 images gain alt text - FAQPage rich results eligible in Search Console (may not show in live results immediately, but foundation is built)

Optimistic case: - FAQPage rich results appear in live Google search for “American Savings Bank common questions” by end of month 2 - AggregateRating stars appear in brand SERP result - Social referral traffic from LinkedIn increases 30% month-over-month in months 2 and 3 - ChatGPT begins citing asbhawaii.com when asked “best bank in Hawaii” (anecdotal, trackable via manual testing)

Conservative case: - All schema deployed and validated with zero errors, but rich results take 60–90 days post-deployment to appear in live search - Social preview cards working, but click-through lift takes 2–3 months to measure with statistical confidence - H1 consolidation and meta tag fixes improve crawl efficiency, observable in Search Console Coverage report but not yet in rankings

Proof Point: What This Work Looks Like Shipped

The audit you just read is theoretical until you see what happens when the recommendations actually get deployed. Here is the most recent example from our portfolio.

Hawaii Theatre

A historic Honolulu performing arts venue. Open since 1922. Eighty to a hundred thousand patrons a year. By traditional SEO standards the website was fine. Real content, real photos, working booking flows.

By AI search standards, the venue was invisible.

When we ran the initial AEO scan, Hawaii Theatre scored **45 out of 100. Grade D.** They had zero AI citations across the queries that matter for their category. The structural gaps were textbook: no PerformingArtsTheater schema, no WebSite SearchAction, no AggregateRating embedded (despite a 4.6 average across hundreds of Google reviews), no FAQPage, no BreadcrumbList anywhere, and zero Event schemas on a page listing 35 live shows.

What we shipped, in ten days

Five schema categories, all delivered through NeverRanked's one-line injection snippet. No engineering work on Hawaii Theatre's site. No CMS changes. No broken design.

- **Foundation schemas (Day 1):** PerformingArtsTheater across every page, WebSite with SearchAction, AggregateRating embedded in the venue block.
- **Event schemas (Day 2):** 31 individual Event entities generated from the live upcoming-events page. Daily refresh cron activated – every morning at 6am UTC the system rescrapes the page and rewrites the schema set. Shows that drop off deactivate. New shows get picked up within 24 hours.
- **Page-level schemas (Day 4):** FAQPage with 8 grounded Q&A pairs from real homepage content. BreadcrumbList across 24 site sections.

The result

- AEO score moved from **45 (Grade D) to 95 (Grade A)** in ten days.
- On the first weekly citation log run after deployment, **Perplexity named Hawaii Theatre on 14 of 19 tracked queries.**

No content campaign. No press push. No paid media. No backlinks. The structured-data layer was the gap. Once the facts were in a format AI engines could parse, retrieval started inside the first weekly run.

What this means for your audit

The work above is replicable. The schema categories listed in your roadmap are the same shape (adapted to your vertical) that Hawaii Theatre's deployment used. The measurement framework (the Citation Tape, our standing AI-citation tracker covering seven engines including the only open-weight model, Gemma) is the same instrument running against your domain when you sign on as a tracked client.

The Hawaii Theatre case study, with the full schema list and the citation tracking output, is at neverranked.com/case-studies/hawaii-theatre. The CEO of Hawaii Theatre Center approved use of the name and the before/after data in conversations like this one.

If you want to see the same arc on your site, the next step is the same as it was for Hawaii Theatre: pick the schema package that fits your vertical (your roadmap above is the starting point), ship it via the snippet, and measure citation share weekly from there.
