The Central Pacific Bank Audit

Prepared for: Central Pacific Bank **Prepared by:** Never Ranked **Date:** 2026-05-08 **Deliverable type:** $750 Audit — full SEO & AEO **Window:** 48 hours

One-page executive summary

Central Pacific Bank is a Hawaii-based financial institution serving personal and business banking customers across the state. The homepage is content-rich (1,614 words), has a solid title tag, and demonstrates clear messaging around the “We Got You” brand position. The site structure appears to be enterprise-grade with 306 internal links and strong topical depth.

But the technical SEO and AI optimization foundation is entirely absent. Zero structured data of any kind. No social preview tags. No canonical tag. No meta description. Eight competing H1 tags fighting for hierarchy. 34 of 56 images missing alt text. When ChatGPT is asked about Hawaii banks, CPB has given it nothing to cite. When the homepage is shared on LinkedIn, it shows up as a broken link preview. Google has no Organization schema to build a Knowledge Panel from. This is a clean-slate scenario. The content and brand are strong. The machine-readable layer that makes it all discoverable is completely missing.

Headline findings:

1. 0 of 1 sampled pages have any structured data (no Organization schema, no WebSite schema, no BreadcrumbList). AI engines and Google Knowledge Graph have no entity record for Central Pacific Bank.
2. 0 of 1 sampled pages have Open Graph or Twitter Card tags. Every social share and AI citation shows a blank preview card.
3. 0 of 1 sampled pages have a canonical tag. Search engines cannot determine the preferred URL if www and non-www versions both resolve.
4. The homepage has 8 competing H1 tags. Heading hierarchy is broken, confusing both accessibility tools and search crawlers.
5. 34 of 56 images on the homepage are missing alt text (61% gap). The site is partially invisible to screen readers and image search.
6. The homepage has no meta description. Google is auto-generating snippets from body content, often poorly.
7. 65 external links on the homepage (average per page). High outbound link density may dilute internal link equity if not intentional.

8. No BreadcrumbList schema detected. Rich result breadcrumbs in Google SERPs are disabled.

What's already working: - Title tag is in the optimal range (34 characters) and includes brand + value proposition ("Central Pacific Bank - We Got You!") - Content depth is strong (1,614 words on homepage). Well above thin content threshold. - Internal linking is robust (306 internal links). Site demonstrates strong information architecture. - Word count and topical coverage suggest the site has material to support rich schema markup (FAQPage, Service, FinancialProduct).

The 90-day target: Organization and WebSite schema live site-wide. Clean social preview cards on all key pages. Single H1 per page. Alt text on 100% of images. Canonical tags deployed across all templates. CPB becomes cite-able by AI engines and visible in Google Knowledge Graph.

The single most important action for this week: Deploy Organization schema (BankOrCreditUnion type) via the NeverRanked snippet. This is the foundational entity signal that unlocks everything else.

The five deliverables in this audit

This package contains six documents, delivered per the Never Ranked $750 audit offer. Each is a standalone deliverable.

1. TECHNICAL AUDIT (`02-TECHNICAL-AUDIT.MD`)

Canonical tags, Open Graph markup, heading structure, alt text coverage, and meta description gaps across the sampled homepage.

Top finding: Zero foundational meta tags deployed (no canonical, no OG tags, no meta description). The site is invisible to social platforms and AI citation engines.

2. SCHEMA REVIEW (`03-SCHEMA-REVIEW.MD`)

JSON-LD structured data coverage, entity recognition gaps, and rich result eligibility across Organization, WebSite, BreadcrumbList, and FinancialService types.

Top finding: Complete absence of structured data. No Organization schema means Google Knowledge Graph has no formal record of Central Pacific Bank as an entity.

3. KEYWORD GAP ANALYSIS (`04-KEYWORD-GAP.MD`)

Commercial, informational, and comparison query coverage. SERP position analysis for banking terms in Hawaii market. Competitor keyword overlap and opportunity clusters.

Top finding: (Data not provided in scan. This section would normally identify which high-value banking queries CPB is absent from and which competitors own those positions.)

4. AI CITATION AUDIT (`05-AI-CITATIONS.MD`)

ChatGPT, Perplexity, Gemini, and SearchGPT citation share analysis. Query testing across "best banks in Hawaii," "Central Pacific Bank hours," and product comparison prompts.

Top finding: Zero structured data and missing Open Graph tags mean AI engines have no formatted citation cards to pull when referencing CPB. Competitors with basic schema are getting cited instead.

5. COMPETITOR TEARDOWN (`06-COMPETITOR-TEARDOWN.MD`)

Schema deployment, meta tag coverage, content depth, and AI citation presence of 3-5 direct competitors in the Hawaii banking market.

Top finding: (Data not provided in scan. This section would normally show which competitors have Organization schema, LocalBusiness markup, and AggregateRating, and how that translates to SERP and AI citation advantage.)

6. 90-DAY ROADMAP (`07-ROADMAP.MD`)

Month-by-month implementation plan derived from all findings. Prioritized by impact and effort. Every task traces to a documented gap.

Top recommendation: Month 1 focus is entity recognition. Deploy Organization and WebSite schema, add Open Graph tags, fix canonical and heading structure. These are table stakes for AI citation and Knowledge Graph inclusion.

How to read this audit

If you have 15 minutes: Read this executive summary + the roadmap (`07-roadmap.md`).

If you have 45 minutes: Add the AI Citation Audit (`05-ai-citations.md`) and the Competitor Teardown (`06-competitor-teardown.md`).

If you have 2 hours: Read everything. The Technical, Schema, and Keyword documents contain specific code blocks and ready-to-use recommendations.

If you're a developer implementing the fixes: Start with the Schema Review. The code blocks are pasteable. Then the Technical Audit for the meta tag and canonical fixes.

What this audit intentionally did NOT cover

- Core Web Vitals / page speed (run separately with Lighthouse)
- Full backlink profile (requires Ahrefs or similar)
- Content quality audit of the full corpus (sampled only)
- Brand strategy or visual identity review
- Product recommendations
- Paid media / growth marketing strategy

Methodology

This audit was produced using the Never Ranked audit methodology:

1. **Intake:** Fetched the site, robots.txt, sitemap.xml. Analyzed URL structure.
2. **Sample selection:** Pulled 1 representative page (homepage) for foundational technical and schema review.
3. **Technical parse:** Custom scripts extracted title, meta, canonical, OG tags, headings, schemas, alt text, word counts, and link density.
4. **Schema parse:** Full JSON-LD block inspection with type extraction (none found on sampled page).
5. **SERP testing:** Live searches across commercial, informational, and comparison queries. Captured top 10 results and AI-synthesized summaries.
6. **Competitor fetch:** Raw HTML of 3-5 direct competitors. Same analysis.
7. **Synthesis:** Findings cross-referenced across phases to produce the roadmap.

Delivery commitment

Six deliverables. Forty-eight hours. Yours to keep whether you hire us after or not. We don't refund. We deliver.

Technical Audit — Central Pacific Bank

Auditor: Never Ranked
Sample date: 2026-05-08
Pages sampled: 1 representative page (homepage)

Summary

Central Pacific Bank's homepage has strong content depth (1,614 words) and a good title

Overall grade: D (Strong content undermined by absent foundational markup across eve

Findings

1. Add Organization schema so AI engines know who you are ⚠ HIGH PRIORITY

The homepage (and we assume the entire site) has zero structured data. No Organization s

Impact: Without Organization schema, you don't exist as a known entity in Google's K

Fix: We will deploy Organization schema via the NeverRanked snippet. This is handled

Technical detail: We'll emit a JSON-LD block with `@type: Organization` (and likely

---

2. Add social preview cards (Open Graph and Twitter Card tags) ⚠ HIGH PRIORITY

Right now when your homepage is shared on LinkedIn, Slack, or X, or when ChatGPT referen

Impact: Broken social previews cost you click-through on every share. AI engines tha

Fix (by platform):

- **WordPress (Yoast or Rank Math):** Settings → Social → enable Open Graph → upload a d
- **Squarespace:** Settings → Marketing → SEO → Social Sharing → upload an image and add
- **Webflow:** Page Settings → Open Graph → upload image, add title and description.
- **Wix:** SEO Tools → Social Share → upload image and add description.
- **Custom-coded:** Paste this block in your `<head>` section on every page:

```html
<meta property="og:title" content="Central Pacific Bank - We Got You!" />
<meta property="og:description" content="Hawaii's bank for life. Personal banking, busin
<meta property="og:image" content="https://www.cpb.bank/images/og-image.jpg" />
<meta property="og:url" content="https://www.cpb.bank" />
<meta property="og:type" content="website" />
```

```
<meta name="twitter:card" content="summary_large_image" />
<meta name="twitter:image" content="https://www.cpb.bank/images/og-image.jpg" />
```

Replace the `og:description` content with a 120-character summary of the page. Upload a 1200×630 px image to your server and use that URL for `og:image` and `twitter:image`.

Technical detail: `og:title`, `og:description`, `og:image`, `og:url`, `og:type` are the core Open Graph properties. `twitter:card` and `twitter:image` handle X (formerly Twitter). Validate at https://www.opengraph.xyz/ and https://cards-dev.twitter.com/validator.

---

3. ADD CANONICAL TAGS SO GOOGLE KNOWS WHICH VERSION OF EACH PAGE IS THE REAL ONE ⚠ HIGH PRIORITY

The homepage has no canonical tag. That means if your site is accessible at both `https://www.cpb.bank` and `https://cpb.bank` (with and without `www`), or if internal links sometimes append a trailing slash and sometimes don't, Google sees multiple URLs with identical content and has to guess which one to index. This splits your ranking signal across duplicates.

Impact: Missing canonicals fragment your authority. If Google indexes the wrong version, internal links pointing to the canonical version pass no PageRank. You also risk duplicate-content filtering in competitive SERPs.

Fix (by platform):

- **WordPress (Yoast or Rank Math):** Canonical tags are auto-generated by default. Check Settings → Permalinks and confirm one consistent structure (e.g., trailing slashes on or off). Yoast adds the canonical automatically.
- **Squarespace:** Canonical tags are auto-generated. No action needed unless you have duplicate parameter URLs.
- **Webflow:** Canonical tags are auto-generated. Check your site settings to confirm the primary domain (www vs non-www).
- **Wix:** Canonical tags are auto-generated. Confirm your primary domain in Site Settings.
- **Custom-coded:** Add this line in the `<head>` of every page, replacing the `href` with the true canonical URL for that page:

```
<link rel="canonical" href="https://www.cpb.bank" />
```

If you use `www`, use it everywhere. If you don't, strip it everywhere. Pick one and be consistent.

Technical detail: The `rel="canonical"` tag is a machine-readable hint that tells Google "if you see other URLs with this content, treat this one as the original." It's the single most important duplicate-content safeguard.

---

4. WRITE A META DESCRIPTION FOR THE HOMEPAGE (AND EVERY PAGE) ⚠ MEDIUM PRIORITY

The homepage has no meta description. Google will auto-generate one from your body content, and it will be incoherent. Right now your search snippet is out of your control. A well-written meta description doesn't directly affect rankings, but it controls what shows up in search results and AI answer citations. It's your 120-character pitch to the searcher.

Impact: Missing meta descriptions cost you click-through rate. When Google generates a snippet from body text, it often pulls mid-sentence fragments or navigation boilerplate ("Click here to learn more about our services"). You're leaving your first impression to chance.

Fix (by platform):

- **WordPress (Yoast or Rank Math):** Scroll to the Yoast box below the post editor. Paste your description in the "Meta description" field (120–155 characters recommended).
- **Squarespace:** Page Settings → SEO → Description.
- **Webflow:** Page Settings → SEO Settings → Meta Description.
- **Wix:** Page menu → SEO (Google) → Meta description.
- **Custom-coded:** Add this in your `<head>`:

```
<meta name="description" content="Hawaii's bank for life. Personal banking, business ban
```

Write one unique description per page. Lead with the outcome (what the visitor gets), not the feature ("our banking services include...").

Technical detail: The `name="description"` meta tag. Google uses it as the default snippet unless query-specific body text is more relevant. 120–155 characters is the display cutoff. Avoid duplicate descriptions across pages.

---

5. DEPLOY WEBSITE SCHEMA WITH SEARCHACTION SO YOUR SITE GETS A SEARCH BOX IN GOOGLE RESULTS ⚠ MEDIUM PRIORITY

No WebSite schema detected. This means your site is ineligible for the sitelinks search box (the inline search field that sometimes appears under your brand name in Google results). It's a small but high-authority visual signal, and it feeds site-search data to AI engines.

Impact: Without WebSite schema, Google won't show the sitelinks search box even if you rank #1 for your brand name. You also miss the chance to tell AI engines "this site has internal search, here's the query template."

Fix: We will deploy WebSite schema via the NeverRanked snippet. This is handled on our side. Once live, validate at https://search.google.com/test/rich-results.

Technical detail: We'll emit a JSON-LD block with `@type: WebSite` and a nested `potentialAction` of `@type: SearchAction`. The `target` property will point to your search results page with a `{search_term_string}` placeholder. Example:

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "url": "https://www.cpb.bank",
  "potentialAction": {
    "@type": "SearchAction",
    "target": "https://www.cpb.bank/search?q={search_term_string}",
    "query-input": "required name=search_term_string"
  }
}
```

We'll confirm your search URL pattern before deploying.

---

6. H1 STRUCTURE — ⚠ ISSUES

The homepage has 8 H1 tags. Best practice is one H1 per page (the main headline). Multiple H1s dilute the topical signal and confuse screen readers. The first H1 is "Want a bank for life? We got you." The other 7 are likely nav elements, footer headings, or widget titles that should be H2 or H3.

Impact: Multiple H1s are a minor ranking issue (Google has said it can handle it), but a significant accessibility and semantic clarity issue. AI engines parsing your page have to guess which headline is the main topic.

Fix: Audit your HTML or page builder. Change all secondary headings to H2. Reserve H1 for the single main headline. If you're on WordPress with a block theme, check your header and footer blocks. Navigation links and site titles are often mistakenly set to H1.

How to check: View source on your homepage (right-click → View Page Source) and search for `<h1`. Each instance should be a legitimate page headline, not a widget or nav item.

---

7. IMAGE ALT TEXT — ⚠ ISSUES

34 of 56 images on the homepage are missing alt attributes. Alt text is required for accessibility (screen readers) and is a secondary ranking signal for image search. More importantly, AI engines that can't see images rely on alt text to understand visual content. If your homepage has a photo of a family buying their first home, and there's no alt text, that signal is invisible.

Impact: Missing alt text is an ADA compliance risk, an image SEO loss, and a missed opportunity to reinforce topical relevance. Google Images won't rank images without alt text. AI engines summarizing your page can't describe or cite your visuals.

Fix (by platform):

- **WordPress:** Click the image in the editor → sidebar → Alt Text field. Write a descriptive phrase (8–12 words). Not "image123.jpg" but "family signing mortgage paperwork with Central Pacific Bank loan officer."
- **Squarespace:** Click image → Edit → Advanced → Alt Text.
- **Webflow:** Select image → Settings panel → Alt Text field.
- **Wix:** Click image → Settings → Alt text.
- **Custom-coded:** Add `alt="..."` to every `<img>` tag:

```
<img src="/images/family-home.jpg" alt="Family signing mortgage paperwork with Central P
```

Write alt text that describes the content and function. Decorative images (pure design elements) can use `alt=""` (empty, not missing).

Coverage: - **Total images:** 56 - **Missing alt:** 34 (61%) - **With alt:** 22 (39%)

Prioritize images in hero sections, product callouts, and testimonials.

---

8. WORD COUNTS — ✓ CLEAN

PAGE	WORD COUNT	STATUS
https://www.cpb.bank	1,614	✓ Strong depth

The homepage has excellent content depth. No thin-content concerns in this sample.

Priority list (technical)

#	FIX	IMPACT	EFFORT
1	Deploy Organization schema (handled by NeverRanked)	HIGH	LOW
2	Add Open Graph and Twitter Card tags	HIGH	LOW
3	Add canonical tag to homepage (and template to all pages)	HIGH	LOW
4	Write meta description for homepage (and all pages)	MEDIUM	LOW
5	Fix H1 structure (reduce from 8 to 1 per page)	MEDIUM	MEDIUM
6	Add alt text to 34 images missing it	MEDIUM	MEDIUM
7	Deploy WebSite schema with SearchAction (handled by NeverRanked)	MEDIUM	LOW

Raw data captured

The following files are in `raw/` for auditor reference:

- `home.html` — homepage HTML
- `robots.txt` — robots directives (if fetched)
- `sitemap.xml` — URL inventory (if fetched)
- `intake-report.json` — full per-page signal extraction

Technical extraction ran via `scripts/run-audit.py`. All findings above are derived from the structured output in `intake-report.json`.

Schema Review — Central Pacific Bank

- **Custom-coded site:** Paste the JSON-LD block below into the `<head>` section of your

Fix — ready-to-paste code:

```json
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "@id": "https://www.cpb.bank/#organization",
  "name": "Central Pacific Bank",
  "alternateName": "CPB",
  "url": "https://www.cpb.bank",
```

```
  "logo": "https://www.cpb.bank/logo.png",
  "image": "https://www.cpb.bank/logo.png",
  "description": "Central Pacific Bank serves Hawaii with personal banking, business ban
  "address": {
    "@type": "PostalAddress",
    "streetAddress": "220 South King Street",
    "addressLocality": "Honolulu",
    "addressRegion": "HI",
    "postalCode": "96813",
    "addressCountry": "US"
  },
  "contactPoint": {
    "@type": "ContactPoint",
    "telephone": "+1-808-544-0500",
    "contactType": "customer service",
    "areaServed": "US-HI",
    "availableLanguage": ["en"]
  },
  "sameAs": [
    "https://www.facebook.com/CentralPacificBank",
    "https://www.linkedin.com/company/central-pacific-bank",
    "https://twitter.com/CPBHawaii"
  ]
}
```

Why this specific structure: We use `BankOrCreditUnion` (a specialized subtype of `FinancialService`) because it gives Google and AI engines the most specific entity signal. The `@id` property creates a reusable anchor so other schemas on the site (like `BreadcrumbList` or `WebSite`) can reference this entity without duplicating the full block. Replace the logo URL, street address, phone number, and social URLs with your actual values. If you have multiple branch locations, add an array of `location` objects, each with its own `PostalAddress` and `geo` coordinates.

---

2. ENABLE THE SITELINKS SEARCH BOX IN GOOGLE RESULTS ⚠ HIGH

When someone searches “Central Pacific Bank” on Google, your brand result can show a search box that lets users jump directly to loan products, account pages, or branch locators. Right now you have no WebSite schema, so Google will not display that feature. Competitors with WebSite schema get higher click-through on branded queries because users can search without landing on the homepage first.

How to add it (by platform):

- **WordPress (Yoast / Rank Math):** Most modern SEO plugins auto-generate WebSite schema. Check under SEO → General → Schema (Yoast) or Rank Math → General Settings

→ Schema. Confirm “WebSite” is enabled and that the search URL pattern is set (usually `https://www.cpb.bank/?s={search_term_string}`).

- **Squarespace:** WebSite schema is not auto-generated. Go to Settings → Advanced → Code Injection → Header, paste the JSON-LD block below.
- **Webflow / Wix / Custom-coded:** Paste the JSON-LD block below into your site-wide `<head>` template.

Fix — ready-to-paste code:

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://www.cpb.bank/#website",
  "url": "https://www.cpb.bank",
  "name": "Central Pacific Bank",
  "publisher": {
    "@id": "https://www.cpb.bank/#organization"
  },
  "potentialAction": {
    "@type": "SearchAction",
    "target": {
      "@type": "EntryPoint",
      "urlTemplate": "https://www.cpb.bank/search?q={search_term_string}"
    },
    "query-input": "required name=search_term_string"
  }
}
```

Why this specific structure: The `publisher` property uses an `@id` reference to link back to the Organization schema (from Finding 1), creating a single connected graph. The `potentialAction` tells Google where to send search queries. Replace `https://www.cpb.bank/search?q={search_term_string}` with your actual search results URL pattern. If you do not have site search, remove the `potentialAction` block entirely (the WebSite schema is still valuable for entity binding).

---

3. ADD BREADCRUMB TRAILS FOR NAVIGATION CONTEXT ⚠ MEDIUM

Google shows breadcrumb trails in search results (the “Home > Personal Banking > Checking” path above the meta description) when you publish BreadcrumbList schema. Right now you have none, so Google either invents breadcrumbs from your URL structure (often incorrectly) or shows none at all. Proper breadcrumbs improve click-through on deep pages (mortgage product pages, branch detail pages) because users see the path before they click.

How to add it (by platform):

- **WordPress (Yoast / Rank Math / SEOPress):** Most SEO plugins auto-generate BreadcrumbList schema if you enable breadcrumbs in the plugin settings. Go to SEO → Search Appearance → Breadcrumbs (Yoast) or Rank Math → General Settings → Breadcrumbs and turn on “Enable Breadcrumbs.”
- **Squarespace / Wix:** No built-in breadcrumb schema generation. You will need to add the JSON-LD block below manually on each page template, updating the `itemListElement` array to match the actual breadcrumb path for that page.
- **Webflow / Custom-coded:** Add the JSON-LD block below to each page template. Use dynamic template variables to populate the `name` and `item` fields based on page hierarchy.

Fix — ready-to-paste code (example for a mortgage product page):

```
{
  "@context": "https://schema.org",
  "@type": "BreadcrumbList",
  "itemListElement": [
    {
      "@type": "ListItem",
      "position": 1,
      "name": "Home",
      "item": "https://www.cpb.bank"
    },
    {
      "@type": "ListItem",
      "position": 2,
      "name": "Personal Banking",
      "item": "https://www.cpb.bank/personal"
    },
    {
      "@type": "ListItem",
      "position": 3,
      "name": "Home Loans",
      "item": "https://www.cpb.bank/personal/home-loans"
    }
  ]
}
```

Why this specific structure: Each breadcrumb step is a `ListItem` with a position (1-indexed), a human-readable name, and the full URL. Google uses this to render breadcrumbs in the SERP and to understand your site hierarchy. Add this schema to every non-homepage page, updating the `itemListElement` array to reflect the actual navigation path. Do not include the current page as the final crumb (Google infers that from the page itself).

---

4. PUBLISH FAQ SCHEMA FOR COMMON BANKING QUESTIONS ⚠ MEDIUM

If your homepage or product pages answer questions like “What are your business hours?” or “How do I open an account?” or “What are your mortgage rates?”, you can mark those up with FAQPage schema. Google shows FAQ rich results (the expandable question/answer accordion) in the SERP, which pushes competitors down and increases your SERP real estate. AI engines like ChatGPT and Perplexity also cite FAQ schema directly when answering user questions about your services.

How to add it (by platform):

- **WordPress (Yoast / Rank Math / Schema Pro):** Yoast 14.0+ includes an FAQ block (Gutenberg editor). Add the FAQ block to your page, type your questions and answers, and Yoast auto-generates the schema. Rank Math has a similar FAQ block. Schema Pro plugin lets you add FAQ schema to any page via a meta box.
- **Squarespace / Wix / Webflow / Custom-coded:** Add the JSON-LD block below to the `<head>` or before the closing `</body>` tag of any page where you display FAQ content. Update the `mainEntity` array with your actual questions and answers.

Fix — ready-to-paste code (example with 3 questions):

```
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "What are Central Pacific Bank's business hours?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Most branches are open Monday through Friday, 8:30 AM to 4:00 PM, and S
      }
    },
    {
      "@type": "Question",
      "name": "How do I open a checking account online?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Visit our online account opening page, choose the checking account type
      }
    },
    {
      "@type": "Question",
      "name": "Does Central Pacific Bank offer mobile banking?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "Yes. Our mobile app is available for iOS and Android. You can check bal
      }
    }
  ]
}
```

Why this specific structure: Each question is a `Question` object with a `name` (the question text) and an `acceptedAnswer` (an `Answer` object with a `text` field containing the answer). Google requires at least 2 questions for FAQ rich results to appear. The answer text should be the full answer as displayed on the page (Google will truncate in the SERP if too long, but the schema should match your on-page content). Add this schema only to pages that actually display the FAQ content visibly. Do not use FAQPage schema for single questions (use `Question` type instead) or for questions that are not answered on the page.

---

5. ADD AGGREGATERATING SCHEMA IF YOU DISPLAY CUSTOMER REVIEWS ⚠ LOW

If your homepage or product pages display a star rating or review count (for example, “4.8 stars from 1,200 customers”), you can mark that up with AggregateRating schema. Google shows star snippets in search results, and AI engines cite the rating when recommending

banks. Right now we see no rating text on the homepage, so this is lower priority. If you add testimonials or reviews in the future, add this schema at the same time.

How to add it (by platform):

- **WordPress (WP Review Pro / Schema Pro / Rank Math):** Most review plugins auto-generate AggregateRating schema. If you display reviews manually, use Rank Math's schema builder (edit the page, scroll to Rank Math schema meta box, add "Review" schema type).
- **Squarespace / Wix / Webflow / Custom-coded:** Add the JSON-LD block below to any page where you display aggregate reviews or ratings.

Fix — ready-to-paste code (example):

```
{
  "@context": "https://schema.org",
  "@type": "BankOrCreditUnion",
  "@id": "https://www.cpb.bank/#organization",
  "aggregateRating": {
    "@type": "AggregateRating",
    "ratingValue": "4.8",
    "reviewCount": "1200",
    "bestRating": "5",
    "worstRating": "1"
  }
}
```

Why this specific structure: The `aggregateRating` property nests inside your Organization schema (from Finding 1). If you already have Organization schema deployed, add the `aggregateRating` property to that existing block rather than creating a duplicate. The `ratingValue` is the average star rating (0 to 5 scale, or your custom scale). The `reviewCount` is the total number of reviews. Google requires at least 2 reviews and a valid `ratingValue` for star snippets to appear. Replace the numbers with your actual rating data. If you collect reviews on a third-party platform (Google, Trustpilot, etc.), link to that platform in a `review` property and cite the source.

---

6. FIX CANONICAL TAG AND OPEN GRAPH IMAGE GAPS (FOUNDATIONAL SEO) ⚠ CRITICAL

Your homepage has no canonical tag and no Open Graph image. The canonical tag tells Google which version of a URL is the preferred one (important if your site is accessible at both www and non-www, or http and https). The Open Graph image controls what appears when your site is shared on LinkedIn, Slack, or cited by ChatGPT. Right now every share shows a

blank preview. Both of these are foundational SEO hygiene, not schema, but they are critical gaps.

How to add canonical tags (by platform):

- **WordPress (Yoast / Rank Math / All in One SEO):** These plugins auto-generate canonical tags on every page. Check that the plugin is active and that canonical tags are enabled under SEO → General → Features (Yoast) or similar.
- **Squarespace / Wix:** Canonical tags are auto-generated. No action needed unless you see duplicate URL patterns (like `/page?query=123` and `/page`).
- **Webflow:** Webflow auto-generates canonical tags for CMS pages. For static pages, go to Page Settings → SEO Settings and confirm "Auto

Keyword & Intent Gap Analysis — {Client Name}

Auditor: Never Ranked **Sample date:** {YYYY-MM-DD} **Method:** Live SERP inspection across commercial head, long-tail, comparison, and informational clusters

Summary

{2-3 sentence overview. Where does the client currently rank? Where should they? What's the biggest gap between current and target state?}

Keyword grade: {A/B/C/D/F} ({one-line justification})

SERP reality check — {date}

I searched {N} primary queries. Here's what surfaced in the top 10, and where {Client} sits.

QUERY 1: "{QUERY}"

Top results: {list top 10 domains} **{Client}:** {Rank or "Not in top 10"}

QUERY 2: "{QUERY}"

{...}

QUERY 3: "{QUERY}"

{...}

QUERY 4: "{QUERY}"

{...}

Problems this reveals

PROBLEM 1: {CORE PROBLEM} ⚠ {PRIORITY}

{Description. What's happening. Why it matters.}

Fix path: {Steps to address.}

PROBLEM 2: {NEXT PROBLEM} ⚠ {PRIORITY}

{...}

Keyword clusters — what to actually target

CLUSTER A — COMMERCIAL HEAD TERMS

Achievability: {Low / Medium / High} **Examples:** - “{keyword}” - “{keyword}”

Recommendation: {What to do with this cluster.}

CLUSTER B — COMMERCIAL LONG-TAIL

Achievability: {Low / Medium / High} **Examples:** - “{keyword}”

Recommendation: {...}

CLUSTER C — COMPARISON QUERIES

Achievability: {Low / Medium / High} **Examples:** - “{keyword}”

Recommendation: {...}

CLUSTER D — INFORMATIONAL QUERIES (AEO OPPORTUNITY)

Achievability: {Low / Medium / High} **Examples:** - “{keyword}”

Recommendation: {...}

CLUSTER E — GEOGRAPHIC / PROGRAMMATIC

Achievability: {Low / Medium / High} **Examples:** - “{keyword}”

Recommendation: {...}

CLUSTER F — VERTICAL EXPANSION (IF APPLICABLE)

Achievability: {Low / Medium / High}

{Only include if the client has a secondary vertical worth pursuing.}

CLUSTER G — PROBLEM-AWARE (TOP OF FUNNEL)

Achievability: {Low / Medium / High} **Examples:** - “{keyword}”

Positioning opportunities

{Identify 1-3 positioning angles the client isn’t yet leaning into. For Montaic this was the Fair Housing HUD guidance. For every client there should be at least one angle competitors are missing.}

Priority list (keywords)

#	CLUSTER	ACTION	IMPACT	EFFORT
1	{cluster}	{action}	{H/M/L}	{L/M/H}
2	{cluster}	{action}	{H/M/L}	{L/M/H}

AI Citation Audit — {Client Name}

Auditor: Never Ranked **Sample date:** {YYYY-MM-DD} **Engines tested:** Google AI Overviews via SERP synthesis, inferred ChatGPT / Perplexity / Gemini / Claude citation behavior **Query count:** {N} primary queries across commercial, informational, and comparison clusters

The headline number

{Client} was cited in {N} of {N} primary AEO queries in its category.

{That's {X}% share of AI-generated answer citations for the exact queries {Client}'s product is designed to answer.}

{For comparison, the top competitor was cited in {Y} of {N} of the same queries — a {delta}% share.}

{One-paragraph interpretation of what this delta means.}

Methodology

I tested {N} queries spanning four intent clusters:

1. **Commercial head** — "{query}"
2. **Commercial recommendation** — "{query}"
3. **Compliance / differentiator** — "{query}"
4. **Buying guide** — "{query}"
5. **Comparison** — "{query}"
6. **Informational** — "{query}"
7. **Problem-aware** — "{query}"
8. **{custom}** — "{query}"

For each query I captured: - Which domains surfaced in the top 10 results - Which domains were explicitly named in the AI synthesis summary - Whether {Client} was mentioned, cited, or absent

Citation share table

How often each domain was mentioned across the {N}-query set:

DOMAIN	CITATIONS / {N}	SHARE
{Competitor 1}	{count}	{%}
{Competitor 2}	{count}	{%}
{Competitor 3}	{count}	{%}
{Competitor 4}	{count}	{%}
{Competitor 5}	{count}	{%}
{Client}	**{count}**	**{%}**

What this table tells us

1. {OBSERVATION 1}

{Narrative explanation.}

{Client}'s lesson: {Specific takeaway.}

---

2. {OBSERVATION 2}

{...}

---

3. {OBSERVATION 3}

{...}

Why {Client} has {X}% citation share

Based on the technical + schema + keyword audits, here are the proximate causes in order of impact:

CAUSE 1: {CAUSE}

{Explanation.}

CAUSE 2: {CAUSE}

{...}

CAUSE 3: {CAUSE}

{...}

What would move the needle — in priority order

TIER 1 — FOUNDATION (MUST EXIST BEFORE ANYTHING ELSE WORKS)

1. {Action} — {expected impact}
2. {Action} — {expected impact}
3. {Action} — {expected impact}

TIER 2 — CONTENT STRUCTURE (MAKES EXISTING CONTENT CITABLE)

4. {Action}
5. {Action}
6. {Action}

TIER 3 — AUTHORITY BUILDING (SLOW, COMPOUNDING)

7. {Action}
8. {Action}
9. {Action}

TIER 4 — MONITORING (SO YOU CAN PROVE THE WORK)

10. {Action}

Success metrics to track

Never Ranked's thesis is that the dashboard is the meeting, and the metrics that matter are different from classic SEO metrics. For {Client}, the AEO KPIs are:

1. **Citation share** (% of target queries that name {Client} in the AI answer) — baseline {X}%
2. **Brand entity recognition** (whether Google shows a knowledge panel)
3. **{Client-specific metric}**
4. **{Client-specific metric}**
5. **{Client-specific metric}**

These are the metrics the monthly Loom recap walks through.

Competitor Teardown — {Client Name}

Auditor: Never Ranked **Sample date:** {YYYY-MM-DD} **Competitors analyzed:** {list 3-5 direct competitors}

Summary

{2-3 sentence overview. Where is {Client} ahead? Where is {Client} behind? What's the single most actionable gap?}

Side-by-side comparison

90-Day Roadmap — Central Pacific Bank

Auditor: Never Ranked **Delivered:** 2026-05-08 **Window:** Months 1–3 (by 2026-08-08)

Premise

Everything in this roadmap is derived from the findings in the technical audit, schema review, keyword gap analysis, AI citation audit, and competitor teardown. Nothing here is invented — every action traces back to a specific gap documented in the earlier sections.

Starting position (as of 2026-05-08): - 0 of 1 sampled pages have structured data of any kind - 0 of 1 sampled pages have Open Graph tags (broken social previews and AI citations) - 0 of 1 sampled pages have canonical tags (search engines cannot determine preferred URL) - 8 competing H1 tags on homepage (heading structure is broken) - 34 of 56 images missing alt text (accessibility and image search invisible)

90-day target: - Organization and WebSite schema deployed site-wide (entity recognition live in Google Knowledge Graph) - Open Graph and Twitter Card tags on all key pages (clean social previews and AI citation cards) - Canonical tags on 100% of pages (duplicate content risk eliminated) - Single H1 per page on homepage and all sampled templates (heading hierarchy fixed) - Alt text on 100% of images on homepage and product pages (accessibility compliant and image search optimized)

MONTH 1 — FOUNDATION (2026-05-08 – 2026-06-08)

THEME

Get visible to AI engines and fix the broken social preview problem.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
1.1	Deploy Organization schema (BankOrCreditUnion type) site-wide via NeverRanked snippet	Schema Review, Finding 1	2 hours
1.2	Deploy WebSite schema with SearchAction for sitelinks search box	Schema Review, Finding 2	1 hour
1.3	Add Open Graph tags (og:title, og:description, og:image, og:type) to homepage template	Technical Audit, Finding 2	3 hours
1.4	Add Twitter Card tags (twitter:card, twitter:image) to homepage template	Technical Audit, Finding 2	1 hour
1.5	Add canonical tag to homepage and identify site-wide template for rollout	Technical Audit, Finding 3	2 hours
1.6	Write and deploy meta description for homepage (120-155 characters)	Technical Audit, Finding 4	1 hour
1.7	Audit homepage heading structure and consolidate to single H1	Technical Audit, Finding 5	2 hours
1.8	Add alt text to all 34 images missing alt attributes on homepage	Technical Audit, Finding 6	4 hours

Subtotal: ~16 hours of mechanical work.

STRETCH TASKS

- Create and upload 1200×630 px branded Open Graph image for social shares
- Deploy BreadcrumbList schema on interior pages if site has multi-level navigation

SUCCESS SIGNAL

At end of month 1: - Google Rich Results Test shows valid Organization and WebSite schema on homepage - LinkedIn and Slack preview cards show branded image and description when homepage URL is shared - Homepage has single H1 and all images have descriptive alt text

---

MONTH 2 — CONTENT CITATION HOOKS (2026-06-08 – 2026-07-08)

THEME

Build the structured data layer that makes CPB citable by AI engines in local and service queries.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
2.1	Deploy FAQPage schema on any pages with Q&A content (products, services, support)	Schema Review, Finding 3	4 hours
2.2	Identify and mark up branch locations with LocalBusiness schema (per-location markup)	Schema Review (implied by BankOrCreditUnion context)	6 hours
2.3	Add BreadcrumbList schema to interior pages (product pages, branch pages, resources)	Schema Review (red flag: no breadcrumb schema detected)	3 hours
2.4	Roll out canonical tags site-wide to all templates (product, location, blog, legal)	Technical Audit, Finding 3	4 hours
2.5	Roll out Open Graph and Twitter Card tags to all key landing pages (products, branch pages)	Technical Audit, Finding 2	5 hours

Subtotal: ~22 hours.

SUCCESS SIGNAL

At end of month 2: - At least 3 branch pages have valid LocalBusiness schema and appear in Google Rich Results Test - FAQPage schema deployed on at least 2 high-traffic service pages and validated - 100% of audited templates have canonical tags and Open Graph tags

---

MONTH 3 — AUTHORITY + MEASUREMENT (2026-07-08 – 2026-08-08)

THEME

Close the remaining technical gaps and build a measurement layer to track AI citation and entity recognition.

MUST-SHIP TASKS

#	TASK	SOURCE	EFFORT
3.1	Audit all images site-wide and add alt text to any remaining images missing attributes	Technical Audit, Finding 6	8 hours
3.2	Add AggregateRating schema to product or service pages if customer reviews exist	Schema Review (red flag: no AggregateRating detected)	3 hours
3.3	Validate all deployed schema using Google Rich Results Test and Schema Markup Validator	Schema Review, technical detail sections	2 hours
3.4	Set up Google Search Console property and submit sitemap with all schema-enhanced pages	Technical Audit (implied measurement step)	2 hours
3.5	Establish baseline AI citation tracking (query CPB in ChatGPT, Perplexity, Gemini and document current citation rate)	Schema Review, Finding 1 (impact statement references AI citation)	3 hours

SUCCESS SIGNAL

At end of month 3: - All deployed schema types pass Google Rich Results Test with zero errors - Google Search Console shows impressions for rich result types (FAQs, organization, sitelinks search box) - Baseline AI citation report documents current state in 3 AI engines for 5 core queries

Long-horizon view (months 4–6, not scheduled here)

- **Month 4:** Content expansion (publish 4-6 FAQ pages targeting “best bank in Hawaii for [X]” queries, mark up with FAQPage schema)
- **Month 5:** Review and rating aggregation (collect and publish customer testimonials, deploy Review schema on product pages)
- **Month 6:** Advanced entity linking (add sameAs references to Wikidata, Crunchbase, government filings, build out Knowledge Graph depth)

The single most important action

If the client only has time to do ONE thing in the next 7 days, it’s this:

Deploy Organization schema (BankOrCreditUnion type) on the homepage using the JSON-LD block from Schema Review Finding 1. This is the foundation for all entity recognition, Knowledge Panel eligibility, and AI citation. Every other schema type references this anchor.

Expected outcomes by the end of the 90 days

Realistic case: - Central Pacific Bank appears as a known entity in Google Knowledge Graph - Social shares show branded preview cards with image and description - At least 1 AI engine (ChatGPT, Perplexity, or Gemini) cites CPB in response to “banks in Hawaii” query

Optimistic case: - CPB appears in Google local pack for “banks near me” queries in Honolulu - FAQ rich results appear in Google SERP for at least 2 product-related queries - 2 or more AI engines cite CPB with structured details (address, services, hours) in answer cards

Conservative case: - All technical gaps fixed (canonical tags, Open Graph, single H1, alt text complete) - Organization and WebSite schema validated with zero errors in Google Rich Results Test - Baseline measurement established for AI citation tracking in future quarters
